Patrick Heinemann, 2023-02-22
Doctoral Thesis Dissertation from the year 2022 in the subject Engineering Civil Engineering grade Summa cum laude language English abstract Steel structures which are made of hollow section profiles are mainly used for construction structures There are many fields of applications for structures made of hollow section profiles Hollow section profiles are lightweight and have got a high resistance to compression which is an advantage for column structures The most common profile types have squared or circular hollow cross sections Connecting two or more pipes by welding the joints have got different shapes These joints are part of trusses or columns with a tree shaped optic The standards have got restrictions regarding the geometry material or load cases By choosing a node which is excluded in the standards designing engineers have to create their own models This thesis is about the designing of a Y shaped steel joint full overlapped on top connection which is not defined in current standards up to the time the thesis is created In this thesis only uniplanar joints are investigated A special focus is on the welding line which has got a three dimensional shape The aim is to figure out the

influence on the inclination angle between the two members on the resistance of the joint. Beside this the profile shape and profile thickness vary to see the differences in their resistance. Square and circular hollow section profiles are in focus. To analyse the behaviour of the different steel joints a numerical and experimental investigation is executed. Design charts are created as a medium for designing engineers to calculate the ultimate resistance in the elastic and plastic state depending on the steel profile thickness and inclination angle. The structure of the thesis is split into four main parts. Firstly there is an explanation of the general topic with its difficultness. Secondly there is the state of the art presentation of literature and standards in this range. Thirdly there is a numerical analysis of the joints. The basement of the numerical studies is detailed in pre studies which explain and compare different mesh types or geometrical variations. Fourthly there is an experimental verification of the numerical tests. It is figured out if the inclination angle increase the resistance of the steel joint will decrease significantly. This effect is non linear. Beside this it is found that the full overlapped joint with the squared profile has got a higher resistance than a comparable joint with a similar circular hollow section.

Designers' Guide to EN 1993-1-1 Leroy Gardner, D. A. Nethercot, 2005. After some 25 years in preparation the key parts of EN 1993-1-1 Eurocode 3 Design of steel structures General rules and rules for buildings have now been finalised. Eurocode 3 covers many forms of steel construction and provides the most comprehensive and up to date set of design guidance currently available. Throughout this book concentrates on the most commonly encountered aspects of structural steel design with an emphasis on the situation in buildings. Much of its content is therefore devoted to the provisions of the Part 1-1 General rules and rules for buildings of EN 1993. This is however supplemented by material on loading joints and cold formed design. For each of the principal aspects covered the book provides background to the structural behaviour explanation of the codified treatment including departure from existing practice BS 5950 and numerous worked examples. This Guide should serve as the primary point of reference for designing steel structures to Eurocode 3.
