Biology and Management of Coregonid Fishes, 2005

Małgorzata Jankun, 2007 Coregonids whitefish vendace cisco etc are cold water adapted fishes common throughout the Holarctic in North America Europe and Asia They have evolved into a myriad of forms subspecies and species during and after the Pleistocene glaciations They are therefore rich subjects for the study of evolutionary problems Coregonids support important commercial subsistence and recreational fisheries and are the subject of significant aquaculture operations around the world Although coregonids are generally considered to be fairly adaptable to the pressures of exploitation they do appear to be sensitive to changing environmental conditions such as eutrophication and a number of populations and species have been extirpated usually by deteriorating environments coupled with the introduction of exotic species and by commercial exploitation This sizeable volume contains 40 peer reviewed contributions on current topics of coregonid research presented at the Ninth International Symposium on the Biology and Management of Coregonid Fishes held in August 2005 in Olsztyn Poland They cover all aspects of coregonid life and management The contributions can be grouped into five subject areas genetics and evolution biology life history and population dynamics invasive species fisheries in Europe and fisheries in North America

Goodman, Samuel J. Purkis, Stuart R. Phinn, 2013-04-18 Remote sensing stands as the defining technology in our ability to monitor coral reefs as well as their biophysical properties and associated processes at regional to global scales With overwhelming evidence that much of Earth's reefs are in decline our need for large scale repeatable assessments of reefs has never been so great Fortunately the last two decades have seen a rapid expansion in the ability for remote sensing to map

and monitor the coral reef ecosystem its overlying water column and surrounding environment Remote sensing is now a fundamental tool for the mapping monitoring and management of coral reef ecosystems Remote sensing offers repeatable quantitative assessments of habitat and environmental characteristics over spatially extensive areas As the multi disciplinary field of coral reef remote sensing continues to mature results demonstrate that the techniques and capabilities continue to improve New developments allow reef assessments and mapping to be performed with higher accuracy across greater spatial areas and with greater temporal frequency The increased level of information that remote sensing now makes available also allows more complex scientific questions to be addressed As defined for this book remote sensing includes the vast array of geospatial data collected from land water ship airborne and satellite platforms The book is organized by technology including visible and infrared sensing using photographic multispectral and hyperspectral instruments active sensing using light detection and ranging LiDAR acoustic sensing using ship autonomous underwater vehicle AUV and in water platforms and thermal and radar instruments
