Module B, Anchor 4

Key Concepts:

- The biological influences on organisms are called biotic factors. The physical components of an ecosystem are called abiotic factors.
- Primary producers are the first producers of energy-rich compounds that are later used by other organisms. Organisms that rely on other organisms for energy and nutrients are called consumers.
- Energy flows through an ecosystem in a one-way stream, from primary producers to various consumers. Pyramids of energy show the relative amount of energy available at each trophic level of a food chain or food web. A pyramid of biomass illustrates the relative amount of living organic matter available at each trophic level of an ecosystem. A pyramid of numbers shows the relative number of organisms at each trophic level in an ecosystem.
- Unlike the one-way flow of energy, matter is recycled within and between ecosystems. Water continuously flows between the oceans, the atmosphere, and land – sometimes outside organisms and sometimes inside organisms. Every organism needs nutrients to build tissues and carry out life functions. Like water, nutrients pass through organisms and the environment through biogeochemical cycles. The carbon, nitrogen, and phosphorus cycles are particularly important for life.
- A region's climate is defined by year-after-year patterns of temperature and precipitation. Global climate is shaped by many factors, including solar energy trapped in the biosphere, latitude, and the transport of heat by winds and ocean currents.
- A niche is the range of physical and biological conditions in which a species lives and the way the species obtains what it needs to survive and reproduce.
- By causing species to divide resources, competition helps determine the number and kinds of species in a community and determine the number and kinds of species in a community and the niche each species occupies.
- Predators can affect the size of prey populations in a community and determine the places prey can live and feed. Herbivores can affect both the size and distribution of plant populations in a community and can determine the places certain plants can survive and grow.
- Biologists recognize three main classes of symbiotic relationships in nature: mutualism, parasitism, and commensalism.
- Ecosystems change over time, especially after disturbances, as some species die out and new species move in. Secondary succession in healthy ecosystems following natural disturbances often reproduces the original climax community. Ecosystems may or may not recover from human disturbances.
- Biomes are described in terms of abiotic factors like climate and soil type, and biotic factors like plant and animal life.
- Ecologists typically divide the ocean into zones based on depth and distance from shore.
- The factors that can affect population size are the birthrate, the death rate, and the rate at which individuals enter or leave the population.
