

**ECON 5340 Applied Econometrics – Exam #2**

True or False. Five points per question: 2 pts for a correct T/F and 3 pts for the explanation.

1. Measurement error in the dependent variable is more serious than measurement error in the explanatory variables.

*False. Measurement error in the dependent variable only adds more noise to the model, reducing the goodness of fit, but it does not bias the coefficients. Measurement error in the independent variables, however, biases the coefficient estimates toward zero.*

2. Autocorrelation biases the coefficients towards zero.

*False. Autocorrelation does not bias the coefficient estimates but OLS estimates are no longer efficient.*

3. Severe multicollinearity will bias the coefficient estimates.

*False. Provided the multicollinearity (MC) is not perfect, MC does not bias the coefficients. OLS estimates are still unbiased and efficient. However, the standard errors are inflated relative to the case of no MC.*

4. Ordinary least squares is a special case of generalized least squares.

*True. Generalized least squares (GLS) involves a transformation of the variables so that the Classical assumptions hold. If there is no heteroscedasticity or autocorrelation, then OLS is simply a special case of GLS where no transformation is necessary.*

5. The “runs test” for autocorrelation is immune from Type I errors.

*False. A Type I error involves rejecting a true null hypothesis. This is possible if the sample is not representative and suggests autocorrelation when there is none in the data-generating process.*
