Carroll Spacetime And Geometry New Edition:

Spacetime and Geometry Sean Carroll, 2013-08 Spacetime and Geometry An Introduction to General Relativity provides a lucid and thoroughly modern introduction to general relativity for advanced undergraduates and graduate students It introduces modern techniques and an accessible and lively writing style to what can often be a formal and intimidating subject Readers are led from physics of flat spacetime special relativity through the intricacies of differential geometry and Einstein's equations and on to exciting applications such as black holes gravitational radiation and cosmology Subtle points are illuminated throughout the text by careful and entertaining exposition A straightforward and lucid approach balancing mathematical rigor and physical insight are hallmarks of this important text **Spacetime and Geometry** Sean Carroll, Sean M. Carroll, 2004 **Spacetime and Geometry** Lawrence C. Shepley, Richard Alfred Matzner, 1982 Why is the universe so symmetrical Dennis Sciama Null congruences and Plebanski Schild spaces Ivor Robinson Linearization stability Dieter Brill Nonlinear model field theories based on harmonic mappings Charles W Misner Gravitational fields in general relativity Roy F Kerr On the potential barriers surrounding the Schwarzschild black hole S Chandrasekhar The initial value problem and beyond James W York Jr and Tsvi Piran *Introduction to Tensor Analysis and the Calculus of Moving Surfaces* Pavel Grinfeld, 2013-09-24 This textbook is distinguished from other texts on the subject by the depth of the presentation and the discussion of the calculus of moving surfaces which is an extension of tensor calculus to deforming manifolds Designed for advanced undergraduate and graduate students this text invites its audience to take a fresh look at previously learned material through the prism of tensor calculus Once the framework is mastered the student is introduced to new material which includes differential geometry on manifolds shape optimization boundary perturbation and dynamic fluid film equations The language of tensors originally championed by Einstein is as fundamental as the languages of calculus and linear algebra and is one that every technical scientist ought to speak The tensor technique invented at the turn of the 20th century is now considered classical Yet as the author shows it remains remarkably vital and relevant The author s skilled lecturing capabilities are evident by the inclusion of insightful examples and a plethora of exercises A great deal of material is devoted to the geometric fundamentals the mechanics of change of variables the proper use of the tensor notation and the discussion of the interplay between algebra and geometry The early chapters have many words and few equations The definition of a tensor comes only in Chapter 6 when the reader is ready for it While this text maintains a consistent level of rigor it takes great care to avoid formalizing the subject The last part of the textbook is devoted to the Calculus of Moving Surfaces It is the first textbook exposition of this important technique and is one of the gems of this text A number of exciting applications of the calculus are presented including shape optimization boundary perturbation of boundary value problems and dynamic fluid film equations developed by the author in recent years Furthermore the moving surfaces framework is used to offer new derivations of classical results such as the geodesic equation and the celebrated Gauss Bonnet theorem

An Introduction to Covariant Quantum Mechanics Josef Janyška, Marco Modugno, 2022-04-06 This book deals with an original contribution to the hypothetical missing link unifying the two fundamental branches of physics born in the twentieth century General Relativity and Quantum Mechanics Namely the book is devoted to a review of a covariant approach to Quantum Mechanics along with several improvements and new results with respect to the previous related literature The first part of the book deals with a covariant formulation of Galilean Classical Mechanics which stands as a suitable background for covariant Quantum Mechanics The second part deals with an introduction to covariant Quantum Mechanics Further in order to show how the presented covariant approach works in the framework of standard Classical Mechanics and standard Quantum Mechanics the third part provides a detailed analysis of the standard Galilean space time along with three dynamical classical and quantum examples The appendix accounts for several non standard mathematical methods widely used in the body of the book The Dirac Equation in Curved Spacetime Peter Collas, David Klein, 2019-03-21 This book explains and develops the Dirac equation in the context of general relativistic quantum mechanics in a range of spacetime dimensions It clarifies the subject by carefully pointing out the various conventions used and explaining how they are related to each other The prerequisites are familiarity with general relativity and an exposure to the Dirac equation at the level of special relativistic quantum mechanics but a review of this latter topic is given in the first chapter as a reference and framework for the physical interpretations that follow Worked examples and exercises with solutions are provided Appendices include reviews of topics used in the body of the text This book should benefit researchers and graduate students in general relativity and in condensed matter **Introduction to Mathematical Physics** Michael T. Vaughn, 2008-09-26 A comprehensive survey of all the mathematical methods that should be available to graduate students in physics In addition to the usual topics of analysis such as infinite series functions of a complex variable and some differential equations as well as linear vector spaces this book includes a more extensive discussion of group theory than can be found in other current textbooks The main feature of this textbook is its extensive treatment of geometrical methods as applied to physics With its introduction of differentiable manifolds and a discussion of vectors and forms on such manifolds as part of a first year graduate course in mathematical methods the text allows students to grasp at an early stage the contemporary literature on dynamical systems solitons and related topological solutions to field equations gauge theories gravitational theory and even string theory Free solutions manual available for lecturers at www wiley vch de supplements Encyclopedia of Time H.
