Fill in the blanks below with the correct answers.

Kidneys are the "filters" of the excretory system. They control essential balance between body salts and water. They remove from the blood nitrogenous wastes, water, urea, nonvolatile foreign substances, excess salt and excess water. The kidney is enclosed by a connective tissue capsule and is divided into an outer cortex and an inner medulla. The Loop of Henle functions chiefly for water resorption. The liquid waste, urine, collected by the kidneys passes through the ureter to the urinary bladder. Urinary bladder is a strong muscular organ that stores the urine until it can be excreted via the urethra.

mechanisms of evolution were given more credit With the development of the modern evolutionary synthesis in the 1930s and 1940s Darwin s concept of evolutionary adaptation through natural selection became central to modern evolutionary theory and it has now become the unifying concept of the life sciences *The Evidence of Evolution* Nicholas Hotton,1968
