Microbial Ecology and Biotechnological Potential of Alkaline Environments Anne Postec, Isao Yumoto, Amare

Gessesse, Duncan G. G. McMillan, Liliana Morales-Barrera, 2025-11-27 Alkaline environments including soda lakes springs and soils represent extreme environments characterized by high pH levels often exceeding 9.0 and elevated concentrations of carbonate and bicarbonate ions. Despite their harsh conditions, these ecosystems harbor diverse microbial communities that have evolved unique adaptations to thrive in such environments. These ecosystems offer a rich source of novel enzymes, metabolites, and biopolymers with applications in various industries including bioremediation, biotechnology, and pharmaceuticals. This Research Topic aims to provide a comprehensive overview of the microbial ecology and biotechnological potential of alkaline environments and conditions. We seek to deepen our understanding of the microbial diversity, metabolic capabilities, and ecological interactions in these high pH environments. Furthermore, we aim to explore the opportunities for harnessing the unique microbial resources of alkaline ecosystems for innovative biotechnological applications. We welcome all accepted article types including Original Research, Reviews, and Perspectives on the following subjects: Characterization of microbial communities in alkaline environments using high throughput sequencing and metagenomic approaches; Microbial ecology of anthropogenic alkaline environments such as wastewater from cement and textile industries, red mud from alumina production, and lime application in agricultural soils; Microbial metabolic pathways and enzymatic activities involved in carbon, nitrogen, and sulfur cycling in alkaline environments; Ecological roles of alkaliphilic microorganisms in nutrient cycling, mineral precipitation, and ecosystem resilience in alkaline lakes and sediments; Microbial communities in alkaline ecosystems as analogues of ecosystems where life appeared on the primitive earth, indicating origins of life; Microorganisms from alkaline ecosystems as sources of novel enzymes for industrial processes such as lignocellulose degradation, biopolymer synthesis, and biofuel production; Further biotechnological applications of these microorganisms in areas such as agriculture, medicine, and wastewater treatment. **CIESM Congress Proceedings**

Marine environments are fluid. Microorganisms living in the ocean experience diverse environmental changes over wide spatiotemporal scales. For microorganisms and their communities to survive and function in the ocean, they need to have the capacity to sense, respond to, and/or withstand periodic and sporadic environmental changes. This eBook collates a variety of recent research reports and theoretical discussions on the ecoenergetic strategies, community structure, biogeochemical, and ecosystem functions, as well as regulatory processes and mechanisms that marine microorganisms employ in response to environmental gradients and variations. **HPCT Sterile Processing Technician National**

Elliott,Sonia Chamizo,Vincent John Martin Noah Linus Felde,Andrew David Thomas,2024-08-09 Biological soil crusts biocrusts are widely distributed throughout the world and cover approximately 12% of the terrestrial surface Biocrusts are composed of cyanobacteria algae lichens mosses and a great diversity of other microorganisms which bind soil particles together to form a layer of biological soil matrix on the soil surface typically of several millimetres thickness They are important sites of regional and global microbial diversity and perform multiple ecological functions multifunctionality During the evolution of terrestrial life on earth biocrusts are regarded as the main colonising photosynthetic organisms before the advent of vascular vegetation They not only represent the early stages of terrestrial ecosystems but also facilitate the ecosystem s development and succession Therefore biocrusts are recognised as ecological engineers in the natural development of ecosystems and for the restoration of degraded terrestrial ecosystems The development of biocrusts is highly heterogeneous which is reflected on both temporal and spatial scales and this heterogeneity is still clearly visible even in a small scale However up to now only limited knowledge is acquired on biocrust temporal and spatial organisation In particular there still is a large knowledge gap regarding the various biocrust communities under different developmental states and their related physiological metabolisms and ecological functions Therefore in depth studies of these issues will undoubtedly further promote our understanding of the heterogeneous development of biocrusts as well as their ecological multifunctionality in terrestrial ecosystems The relevant contributions are expected to provide a scientific basis for the management of biocrusts and technology development e g cyanobacteria induced biocrust technology for ecological restoration and the promotion of soil health Immunological Biomarkers for Tuberculosis Christof Geldmacher,Hazel Marguerite Dockrell,Novel N. Logue,Stuart E. G. Findlay,Jérôme Comte,2016-01-20 Advances in next generation sequencing technologies omics and bioinformatics are revealing a tremendous and unsuspected diversity of microbes both at a compositional and functional level Moreover the expansion of ecological concepts into microbial ecology has greatly advanced our comprehension of the role microbes play in the functioning of ecosystems across a wide range of biomes Super imposed on this new information about microbes their functions and how they are organized environmental gradients are changing rapidly largely driven by direct and indirect human activities In the context of global change understanding the mechanisms that shape microbial

communities is pivotal to predict microbial responses to novel selective forces and their implications at the local as well as global scale. One of the main features of microbial communities is their ability to react to changes in the environment. Thus many studies have reported changes in the performance and composition of communities along environmental gradients. However, the mechanisms underlying these responses remain unclear. It is assumed that the response of microbes to changes in the environment is mediated by a complex combination of shifts in the physiological properties, single cell activities, or composition of communities. It may occur by means of physiological adjustments of the taxa present in a community or selecting towards more tolerant, better adapted phenotypes. Knowing whether certain factors trigger one, many, or all mechanisms would greatly increase confidence in predictions of future microbial composition and processes. This Research Topic brings together studies that applied the latest molecular techniques for studying microbial composition and functioning and integrated ecological, biogeochemical, and/or modeling approaches to provide a comprehensive and mechanistic perspective of the responses of microorganisms to environmental changes. This Research Topic presents new findings on environmental parameters influencing microbial communities, the type and magnitude of response, and differences in the response among microbial groups, which collectively deepen our current understanding and knowledge of the underlying mechanisms of microbial structural and functional responses to environmental changes and gradients in both aquatic and terrestrial ecosystems. The body of work has furthermore identified many challenges and questions that yet remain to be addressed and new perspectives to follow up on.
