E/M Documentation Assessment Using the TrailBlazer Method

Applicable to Medicare patient encounters in Texas, Virginia, Delaware, Maryland and District of Columbia

There are several different Medicare carriers, of which TrailBlazer is one, and each may have its own set of documentation guidelines. TrailBlazer is the Medicare carrier for Texas, Virginia, Delaware, Maryland and the District of Columbia. Medical documentation audits are broken into 3 categories: History, Exam and Medical Decision Making. Medical Decision Making is determined by the complexity of decision making and is further subdivided into 3 categories: Number of Diagnoses and/or Treatment Options, Data Reviewed or Ordered, and Risk of Complications, Morbidity or Mortality. The values of the subcategories of Medical Decision Making are then used to determine the complexity of Medical Decision Making. The values (supported by documentation) for the History, Exam and the Complexity of Medical Decision Making are then used to determine the overall patient encounter code.

Epitope Discovery and Synthetic Vaccine Design Clarisa Beatriz Palatnik-de-Sousa, Irene da Silva Soares, Daniela Santoro Rosa, 2018-07-12 Since variolation conventional approaches to vaccine development are based on live attenuated inactivated or purified pathogen derived components However effective vaccines against global health threats such as HIV parasite infections and tumors are difficult to achieve On the other hand synthetic vaccines based on immunogenic epitopes offer advantages over traditional vaccines since they are chemically defined antigens free from deleterious effects Additionally in contrast to live attenuated vaccines they do not revert to virulence in immunocompromised subjects and different from genetic vaccines they do not involve ethical questions

Traditional vaccines contain PAMPs and induce strong immune responses while recombinant vaccines are less potent. In spite of the immunogenic weakness previously attributed to epitope based vaccines, a synthetic vaccine containing a 17 amino acid epitope of the *Pseudomonas aeruginosa* Type IV pilus exceeded the protective potential of its cognate protein composed of 115 amino acids. Therefore, the efficacy yield of a synthetic vaccine can be potentiated by using the proper combination of target epitopes. Recent advances in adjuvant development, immunogen platforms for DNA vaccines and viral vectors also contributed to optimize immunogenicity. Another constraint to the use of epitope vaccines was their restriction to some MHC or HLA phenotypes. However, epitopes containing 20 or less amino acids of *Plasmodium falciparum* and *Leishmania donovani* bind to multiple HLA DR and MHC receptors. Thus, synthetic epitope vaccines may better meet the requirements of the regulatory agencies since they have lower costs and are easier to produce. The classical experimental approach for the development of an epitope based vaccine involves the use of recombinant domains or overlapping 15 mer peptides spanning the full length of the target antigen and the analysis of the induced antibody and/or T cell immune responses in vitro or in vivo. On the other hand, in silico tools can select peptides that are more likely to contain epitopes, reducing the number of sequence candidates. T cell epitope prediction dates back to 1980s when the first algorithm was developed based on the identification of amphipathic helical regions on protein antigens. Since then, new methods based on MHC peptide binding motifs or MHC binding properties have been developed. The recent reverse vaccinology concept uses high throughput genome sequencing and bioinformatics tools to identify potential targets of immune responses. The feasibility of this approach was shown for the first time in the design of a vaccine against *Neisseria meningitidis* that is now in phase III clinical trials. In addition, different computational tools allow the determination of crucial genes through comparative analyses between different pathogenic strains. Alternatively, carbohydrates have been considered as key targets in developing safe and effective vaccines to combat cancer, bacterial and viral infections. Tumor associated carbohydrate antigens can be coupled covalently to protein carriers to target MHC receptors and improve immunogenicity and have reached already pre-clinical and clinical studies. In light of the recent availability of genomic tools, we believe that in the near future, an increasing number of vaccine candidates composed of defined epitopes will be available for synthetic vaccines showing improved protection.

Brunner and Suddarth's Textbook of Medical-Surgical Nursing Janice L. Hinkle, Kerry H. Cheever, 2018-08-30. Trusted by nursing fraternity for more than 50 years, Brunner and Suddarth's Textbook of Medical-Surgical Nursing layers essential patient care information, engaging critical thinking exercises and diverse features to help students learn critical content. The South Asian edition is comprehensively updated to customize and keep pace with South Asia's health care environment by including Indian/Asian epidemiologic data of common diseases and disorders, flowcharts of pathophysiologic processes of various diseases and disorders, and psychosocial concepts which is contemporary to South Asian scenario. Furthermore, essential medical-surgical nursing content and diseases/disorders which are specific to South Asia are added to make this textbook
