Uttal, 2014-10-14 The crux of the debate between proponents of behavioral psychology and cognitive psychology focuses on the issue of accessibility Cognitivists believe that mental mechanisms and processes are accessible and that their inner workings can be inferred from experimental observations of behavior Behaviorists on the contrary believe that mental processes and mechanisms are inaccessible and that nothing important about them can be inferred from even the most cleverly designed empirical studies One argument that is repeatedly raised by cognitivists is that even though mental processes are not directly accessible this should not be a barrier to unravelling the nature of the inner mental processes and mechanisms Inference works for other sciences such as physics so why not psychology If physics can work so successfully with their kind of inaccessibility to make enormous theoretical progress then why not psychology As with most previous psychological debates there is no killer argument that can provide an unambiguous resolution In its absence author William Uttal explores the differing properties of physical and psychological time space and mathematics before coming to the conclusion that there are major discrepancies between the properties of the respective subject matters that make the analogy of comparable inaccessibilities a false one This title was first published in 2008 Journal of Proceedings of the ...
