**5. Scientific Writing - State Test Sample Question (CER):**

Information: Only four planets in our solar system are made of rock, Mercury, Venus, Earth, and Mars. Temperatures on Mercury and Venus are over 800-degrees Fahrenheit, while Mars sits around negative 100-degrees Fahrenheit. Mercury and Mars have no suitable atmosphere to breathe, while Venus holds an atmosphere so thick in carbon dioxide it would kill humans. The other 4 planets, Jupiter, Saturn, Uranus, and Neptune, are made of gas and cannot support land dwelling.

Question: A human needs a habitable planet to live. Earth has a planet which planet would the most suitable for humans to live in space? and WHY. (PICKER answer the question in a structured way. Information/Reasons/your conclusion. If INFORMATION is appropriate that conclusion, including why the other planets were not chosen.)

- *There is none to be the most suitable habitable planet for humans if we had to leave Earth.*
- *There is made of rock like Earth, so we could build. There is cold, but humans survive in a wider temperature on Earth of -50-degrees Fahrenheit. There has no atmosphere, but humans can wear oxygen masks to breathe easily.*
- *Mercury and Venus are too hot and would kill humans, so we cannot use them for backups. The gas planets have no surface so we cannot use them for backups. There is the only available option for a backup planet.*

Physics of the Earth's Space Environment Gerd Prölss, 2012-12-06 This book was written for readers interested in learning about the disciplines methods and results of space research perhaps because they happened upon the field during the course of their higher education or professional career or perhaps because they simply feel an urge to know more about the space environment of the Earth The present monograph is based on lectures covering the same topic which have been held regularly over the past years at the University of Bonn Like the lecture series the book is directed at a relatively broad group of students and interested laypersons the only prerequisite being knowledge of fundamental physics and mathematics as usually acquired from introductory college courses in science or engineering curricula More specific knowledge is derived in association with each phenomenon considered These derivations are kept as simple as possible adhering to the principle that when conflicts arise physical insight is preferable to mathematical precision As a rule I strived to avoid the trite phrase It may be easily shown that and tried to present all derivations in readily verifiable steps even if this may seem somewhat tedious to the more advanced readers Also serving clarity and insight are the many illustrations which do indeed often say more than a thousand words Our knowledge of the Earth's space environment has grown exponentially during the last few decades and an attempt to cover all aspects of the field would extend way beyond the scope of an introductory text *Earth and Space*, 2004
