

## 1. Overview

McCAd is a Monte Carlo (MC) CAD-based modeling program. It can be used for converting CAD model to half-space Constructive Solid Geometry (CSG), tessellated (faceted) solid and unstructured mesh for MC codes. Currently supported MC codes are MCNP5/6 (CSG and mesh geometry), TRIPOLI-4 and Geant4 (half-space CSG and tessellated solid). McCAd has been integrated in the open-source SALOME platform, and relies on user interfacing. This manual is intended to provide a guide on how to generate an MC codes input file using McCAd.

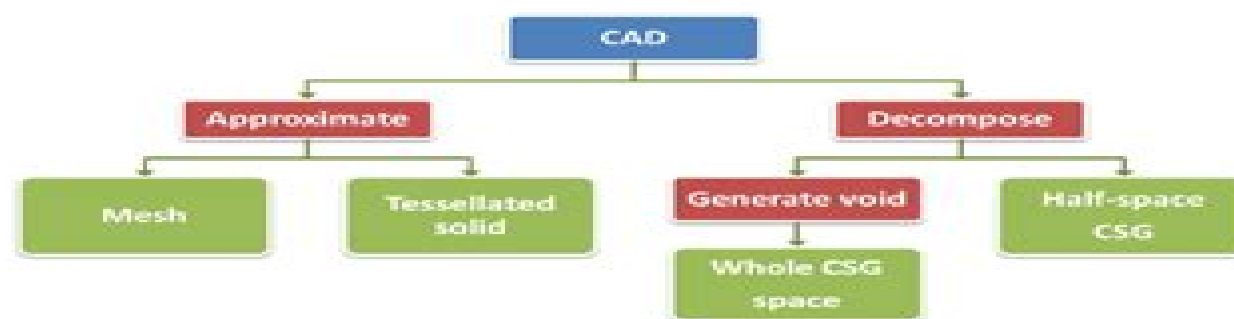

Fig 1.1 McCAd workflow

### 1.1 General workflow

The general workflow of McCAd is shown in Fig 1.1. The McCAd conversion processes include:

- **Decomposing process:** CAD model are decomposed into numbers of solids which can be described as so-called *sign-constant solids* (or half-space solid). These solids are formed by intersections of Boolean half-spaces. **Note:** not all the solid are able to be decomposed by McCAd, user have to check using the “Check before convert” function and try to decompose those solid by themselves, and use “Mark as decomposed” to skip the automatic decomposition. See the following chapters for details.
- **Generating void:** In MC codes such as MCNP, the whole space should be unambiguously defined. McCAd provides a conversion process to describe the void space as well as the solid geometries. The solids has to be sign-constant solids.
- **Approximating process:** CAD geometry can be approximate by tessellated solid or unstructured mesh. Tessellated solid describes the geometry using triangle or quadrangle facets. The unstructured mesh discretizes the CAD geometry using mesh elements. McCAd uses open-source meshing tools *Tetgen* and *Netgen* to generate the unstructured mesh, and use OpenCASCADE library to generate the tessellation facets.
