Fig. 82 - EconoMiSer IV Control

### Differential Enthalpy Control

For differential enthalpy control, the EconoMiSer IV controller uses two enthalpy sensors (BH57AC078 and CRENTDIF004A00), one in the outside air and one in the return air duct. The EconoMiSer IV controller compares the outdoor air enthalpy to the return air enthalpy to determine EconoMiSer IV use. The controller selects the lower enthalpy air (return or outdoor) for cooling. For example, when the outdoor air has a lower enthalpy than the return air, the EconoMiSer IV opens to bring in outdoor air for free cooling.

Replace the standard outside air dry bulb temperature sensor with the accessory enthalpy sensor in the same mounting location. (See Fig. 71.) Mount the return air enthalpy sensor in the return air duct. (See Fig. 80.) Wiring is provided in the EconoMiSer IV wiring harness. (See Fig. 73.) The outdoor enthalpy changeover setpoint is set with the outdoor enthalpy setpoint potentiometer on the EconoMiSer IV controller. When using this mode of changeover control, turn the enthalpy setpoint potentiometer fully clockwise to the D setting.

### Indoor Air Quality (IAQ) Sensor Input

The IAQ input can be used for demand control ventilation control based on the level of CO<sub>2</sub> measured in the space or return air duct.

There is both a factory-installed (FIOP) CO<sub>2</sub> option (sensor 8001B with no display, which is mounted on the side of the EconoMiSer) and a field-installed CO<sub>2</sub> option (sensor 8002 with display, which is mounted on the return air duct). While performing the same function, they differ in their ability to be configured. The FIOP version is preset and requires no changes in most applications. If a configuration change is required, service kit #UIP2072 (software CD, cables, and instructions) and a laptop PC are required. The field-installed version with display can be configured stand-alone. (See section "CO<sub>2</sub> Sensor Configuration".)

Mount the accessory IAQ sensor according to manufacturer specifications. The IAQ sensor should be wired to the AQ and AQ1 terminals of the controller.

Adjust the DCV potentiometers to correspond to the DCV voltage output of the indoor air quality sensor at the user-determined setpoint. (See Fig. 83.)

C06039

Fig. 83 - CO<sub>2</sub> Sensor Maximum Range Settings

If a separate field-supplied transformer is used to power the IAQ sensor, the sensor must not be grounded or the EconoMiSer IV control board will be damaged.

When using demand ventilation, the minimum damper position represents the minimum ventilation position for VOC (volatile organic compounds) ventilation requirements. The maximum demand ventilation position is used for fully occupied ventilation.

When demand ventilation control is not being used, the minimum position potentiometer should be used to set the occupied ventilation position. The maximum demand ventilation position should be turned fully clockwise.

### Exhaust Setpoint Adjustment

The exhaust setpoint will determine when the exhaust fan runs based on damper position (if accessory power exhaust is installed). The setpoint is modified with the Exhaust Fan Setpoint (EXH SET) potentiometer. (See Fig. 77.) The setpoint represents the damper position above which the exhaust fans will be turned on. When there is a call for exhaust, the EconoMiSer IV controller provides a 45 ± 15 second delay before exhaust fan activation to allow the dampers to open. This delay allows the damper to reach the appropriate position to avoid unnecessary fan overload.

### Minimum Position Control

There is a minimum damper position potentiometer on the EconoMiSer IV controller. (See Fig. 77.) The minimum damper position maintains the minimum airflow into the building during the occupied period.

When using demand ventilation, the minimum damper position represents the minimum ventilation position for VOC (volatile organic compound) ventilation requirements. The maximum demand ventilation position is used for fully occupied ventilation.

When demand ventilation control is not being used, the minimum position potentiometer should be used to set the occupied ventilation position. The maximum demand ventilation position should be turned fully clockwise.
