Damage-tolerant Fan Blade Design L. Cernoch,1979

Structural Design and Analysis of Prop-fan Blades R. W.

Cornell,1979 Composite Fan Blade Design for Advanced Engine Concepts National Aeronautics and Space Administration (NASA),2018-06-21 The aerodynamic and structural viability of composite fan blades of the revolutionary Exo Skeletal engine are assessed for an advanced subsonic mission using the NASA EST BEST computational simulation system The Exo Skeletal Engine ESE calls for the elimination of the shafts and disks completely from the engine center and the attachment of the

rotor blades in spanwise compression to a rotating casing The fan rotor overall adiabatic efficiency obtained from aerodynamic analysis is estimated at 91.6 percent The flow is supersonic near the blade leading edge but quickly transitions into a subsonic flow without any turbulent boundary layer separation on the blade The structural evaluation of the composite fan blade indicates that the blade would buckle at a rotor speed that is 3.5 times the design speed of 2000 rpm The progressive damage analysis of the composite fan blade shows that ply damage is initiated at a speed of 4870 rpm while blade fracture takes place at 7640 rpm This paper describes and discusses the results for the composite blade that are obtained from aerodynamic displacement stress buckling modal and progressive damage analyses It will be demonstrated that a computational simulation capability is readily available to evaluate new and revolutionary technology such as the ESE
