Godfrey, Enrico Mugnaini, 2013-03-09 The presence of sophisticated auditory processing in mammals has permitted perhaps the most significant evolutionary development in humans that of language An understanding of the neural basis of hearing is thus a starting point for elucidating the mechanisms that are essential to human communication The cochlear nucleus is the first region of the brain to receive input from the inner ear and is therefore the earliest stage in the central nervous system at which auditory signals are processed for distribution to higher centers Clarifying its role in the central auditory pathway is crucial to our knowledge of how the brain deals with complex stimuli such as speech and is also essential for understanding the central effects of peripheral sensorineural hearing loss caused by for example aging ototoxic drugs and noise Ambitious new developments to assist people with total sensorineural deafness including both cochlear and cochleus nuclear implants require a detailed knowledge of the neural signals received by the brainstem and how these are processed Recently many new data have been obtained on the structure and function of the cochlear nucleus utilizing combinations of anatomical physiological pharmacological and molecular biological procedures Approaches such as intracellular dye filling of physiologically identified neurons localization of classical neurotransmitters peptides receptors and special proteins or gene expression have opened the door to novel morphofunctional correlations
