Significant findings of the physical examination

From the physical examination of the patient, it is derived that; dyspnea (shortness of breath) especially when talking is due to airway obstruction. The blood pressure is higher than normal (normal blood pressure is 120/80) indicating type1 hypertension. The respiratory rate is also higher than normal (normal rate 12-20 breaths per min). Yellowing of teeth is due to prolonged smoking while the pursed-lip breathing (wheezing) could be a result of airway obstruction. Moreover, the jugular distension could be due to hypertension. The use of accessory breathing muscles and the increased anteroposterior diameter of the chest wall indicated labored breathing.

A hyper resonant percussion and a decreased breath sound, increased fremitus on both lower lobes could indicate accumulation of fluid in both these lobes (Weir, 2005). The normal S2 and S1, a regular rhythm indicated lack of a cardiac disease. The drying of extremities and lack of finger clubbing of fingers could be due to hypoxia (reduced oxygen supply.).The bilateral edema in the ankles could have indicated the retention of fluid and salt due to some cardiovascular disorders.

Possible diseases causing the distress

This kind of distress could result from; a pneumonia infection, chronic bronchitis, or even emphysema.
