Objectives

1. Define the term *tissue*, and classify the tissues of the body into four major types.

1. **Tissue:** group of cells that usually have a common origin in an embryo and function together to carry out specialized activities
2. **Histology:** science that deals with the study of tissues

epithelial tissue	<ul style="list-style-type: none"> - body surfaces and lines hollow organs, body cavities, and ducts - forms glands - allows the body to interact with both its internal and external environments
connective tissue	<ul style="list-style-type: none"> - protects and supports the body and its organs - binds organs together - store energy reserves as fat - help provide the body with immunity to disease-causing organisms
muscular tissue	<ul style="list-style-type: none"> - composed of cells specialized for contraction and generation of force - muscular tissue generates heat that warms the body
nervous tissue	<ul style="list-style-type: none"> - detects changes in a variety of conditions inside and outside the body - responds by generating electrical signals called nerve action potentials (nerve impulses) that activate muscular contractions and glandular secretions

2. Describe the structure and functions of the five principal types of cell junctions.

1. **cell junction:** contact points between the plasma membranes of tissue cells

tight junction	adherens junction	desmosome	hemidesmosome	gap junction
