Atomic Structure and Chemical Bonding, a Non-mathematical Introduction Fritz Seel, 1963 **Deciphering the Chemical Code** N. D. Epiotis, 1996 This groundbreaking work the culmination of more than 10 years of research presents a breakthrough theory of chemical bonding across the periodic table Professor Epiotis an internationally known and respected member of the theoretical community challenges the conventional chemical concepts that underlie popular theories of chemical bonding Building on his insight that electron electron repulsion is the single crucial variable that differentiates one chemical system from another the author formulates explains and applies a new approach based on nonorthogonal valence bond methodology that amounts to nothing less than a revolutionary unified theory of chemical bonding across the periodic table This work represents the first post Pauling theory of chemical bonding New theory means new formulae and this work is about new chemical formulae that lead to the self consistent rationalization of existing facts and even more important the design of new chemistry *The Chemical Bond in Inorganic Chemistry* Ian David Brown, 2002 This book describes the bond valence model a description of acid base bonding which is becoming increasingly popular particularly in fields such as materials science and mineralogy where solid state inorganic chemistry is important Recent improvements in crystal structure determination have allowed the model to become more quantitative Unlike other models of inorganic chemical bonding the bond valence model is simple intuitive and predictive and can be used for analysing crystal structures and the conceptual modelling of local as well as extended structures This is the first book to explore in depth the theoretical basis of the model and to show how it can be applied to synthetic and solution chemistry It emphasizes the separate roles of the constraints of chemistry and of three dimensional space by analysing the chemistry of solids Many applications of the model in physics materials science chemistry mineralogy soil science surface science and molecular biology are reviewed The final chapter describes how the bond valence model relates to and represents a simplification of other models of inorganic chemical bonding
