

## Focus

## Overview

Before beginning this section review with your students the objectives listed in the Student Edition. This lesson describes the similarities and differences between protostome and deuterostome development and introduces students to the groups of organisms that show each of these developmental patterns. Students will study echinoderm structure and function and review examples of several different groups of echinoderms.

 Bellringer

Ask students to list the names of as many non-fish marine organisms as they can think of. (Most will be either mollusks or echinoderms.)

## Motivate

## Demonstration

GENERAL

Bring in several preserved or dried specimens of echinoderms such as sea cucumbers, sea stars, and sand dollars. You can supplement these specimens with pictures in books. Allow students to inspect them and come up with as many common characteristics as they can. List those characteristics on the board or overhead, and refer to the list as you teach the specific characteristics.

## Animal Development

If you have been to a saltwater aquarium, you're sure to have seen echinoderms, which are spiny invertebrates that live on the ocean bottom. How could echinoderms like the brittle star shown on the first page of this chapter be related to animals such as chordates, which are primarily vertebrates? The answer lies in their early development. As an embryo develops, it goes through a gastrula stage. As shown in Figure 1, a gastrula has an opening to the outside called the **blastopore**. In acoelomate animals, the mouth develops from or near the blastopore. This pattern of development also occurs in some coelomate animals, such as annelids, mollusks, and arthropods. Animals with mouths that develop from or near the blastopore are called **protostomes**. 

Some animals follow a different pattern of development. In phyla Echinodermata and Chordata, the anus—not the mouth—develops from or near the blastopore. (The mouth forms later, on another part of the embryo.) Animals with this pattern of development are called **deuterostomes**, also shown in Figure 1. If you know the origin of these two terms, it's easy to remember the differences between the two developmental patterns. The term **protostome** is from the Greek *protos*, meaning "first," and *stoma*, meaning "mouth." The prefix *deutero-* is from the Greek *deuteros*, meaning "second." In deuterostomes, the anus develops first and the mouth develops second.  

Figure 1 Embryonic development

The development of an animal embryo follows one of two patterns.
