Kokhanovsky, 2009-07-25 This fourth volume of Light Scattering Reviews is composed of three parts The first part is concerned with theoretical and experimental studies of single light scattering by small nonspherical particles Light scattering by small particles such as for instance droplets in the terrestrial clouds is a well understood area of physical optics On the other hand exact theoretical calculations of light scattering patterns for most of nonspherical and irregularly shaped particles can be performed only for the restricted values of the size parameter which is proportional to the ratio of the characteristic size of the particle to the wavelength For the large nonspherical particles approximations are used e g ray optics The exact theoretical techniques such as the T matrix method cannot be used for extremely large particles such as those in ice clouds because then the size parameter in the visible is the characteristic size radius for spheres and the associated numerical codes become unstable and produce wrong answers Yet another problem is due to the fact that particles in many turbid media e g dust clouds cannot be characterized by a single shape Often refractive indices also vary Because of problems with theoretical calculations experimental laboratory investigations are important for the characterization and understanding of the optical properties of such types of particles The first paper in this volume written by B Gustafson is aimed at the description of scaled analogue experiments in electromagnetic scattering      *Applied Mechanics Reviews*, 1973      **Battelle Technical Review**, 1956      **Holt Chemistry**, 2003      *Electropharmacology* Hendrik Keyzer, George M. Aquatic Parasitology: Ecological and Environmental Concepts and Implications of Marine and Freshwater Parasites. Nico J. Smit, Bernd Sures, 2025-06-16. This open access volume is the first to provide a comprehensive overview of the ecological and environmental characteristics of marine and freshwater parasites. In three clearly organized sections, world leading authors present the current state of our knowledge as well as the future trends for their respective fields in aquatic parasitology. First, the basic life cycle strategies of the various major groups of aquatic parasites are presented, including protists, myxozoa, aquatic fungi, helminths, and arthropods. Subsequent chapters explore the ecological implications of aquatic parasites, covering topics such as biodiversity, evolution, community structures, behavior, and conservation, to name a few. In addition, important developments in research are presented, such as the use of different molecular tools and eDNA in aquatic parasitology. The final section is devoted to the new field of environmental parasitology, where readers will find contributions on biological markers, invasive species, and bioindicators of environmental pollution, among others. Due attention is also given to zoonoses, aquaculture, and the effects of climate change on aquatic parasites. All chapters include original, high quality illustrations and never before seen photographs which complement the diverse aspects of aquatic parasitology described. Thus, this book is a must for every parasitologist and ecologist.
