related issue is how the enhancers communicate to the promoters in a stage specific fashion and in the context of chromatin. Because the factors that regulate chromatin are generally present and active in most cell types how could cell type and or stage specific chromatin architecture be achieved in response to a particular immune signal? The genetic loci that encode lymphocyte cell surface receptors are in an unrearranged or germline configuration during the early stages of development. Thus in addition to expressing lineage and or stage specific transcription factors during each developmental stage lymphocytes also need to rearrange their cognate receptor loci in a strictly ordered fashion. Hence there must be a tightly coordinated communication between the recombination machinery and the transcriptional machinery including chromatin regulators at every developmental step. Mature B cells also undergo classswitch recombination and somatic hypermutation. Importantly along the way these cells must avoid autoimmune responses and only those cells capable of recognizing foreign antigens are preserved to reach peripheral organs where they must function. The exquisite regulation that govern chromatin accessibility, recombination and transcription regulation in response to the environmental signals in the immune system is discussed here in a series of articles.

Life: The Science of Biology David E. Sadava, H. Craig Heller, Gordon H. Orians, William K. Purves, David M. Hillis, 2012-12-10. From its first edition *Life* has set the standard for experiment based introductory biology texts. There is no stronger textbook for helping students understand not just what we know scientifically but how we know it: the experimental process that leads to their discovery. The new edition of *Life* builds upon this tradition teaching fundamental concepts and showcasing significant research while responding to changes in biology education.
