## Nuclear Fission and Fusion

### *Learning Objectives*

- Compare and contrast nuclear fission and nuclear fusion.
- Understand the conservation laws that apply to nuclear reactions.

### *Vocabulary*

- Fission, fusion, transmutation and nuclide.

### *Why?*

Fission and fusion are two processes that alter the nucleus of an atom. Nuclear fission provides the energy in nuclear power plants and fusion is the source of the sun's energy. The use of fission in power plants can help conserve fossil fuels. Without the energy produced by the fusion of the hydrogen in the sun, the Earth would quickly change into a cold planet that could not support life as we know it.

### *Information*

Transmutation is the transformation of the nucleus of an atom so that the atom is changed from one element into a different element. This can be accomplished through many types of reactions, including fission and fusion.

Nuclear transformations always obey two fundamental conservation laws: (1) mass number is conserved and (2) electrical charge is conserved. Energy and mass are not served, but can be inter-converted according to Einstein's equation,  $E=mc^2$ . The amount of binding energy released from the nucleus of an atom during fission and fusion is so tremendous that a small fraction of mass is converted to energy; this is referred to as the mass defect.

### *Model*

#### **1. Fission**

The process of fission occurs when a nucleus splits into smaller pieces. Fission can be induced by a nucleus capturing slow moving neutrons, which results in the nucleus becoming very unstable.

The following equations represent fission reactions, where n = neutron.

**Superconductivity** R.G. Sharma, 2021-06-29 This book presents the basics of superconductivity and applications of superconducting magnets It explains the phenomenon of superconductivity describes theories of superconductivity and discusses type II and high temperature cuprate superconductors The main focus of the book is the application of superconducting magnets in accelerators fusion reactors and other advanced applications such as nuclear magnetic resonance NMR magnetic resonance imaging MRI high gradient magnetic separation HGMS and superconducting magnetic energy storage SMES This new and significantly extended second edition covers the state of the art in the development of novel superconductors for advanced magnet applications as well as the production of practical superconducting wires tapes and ultra high current cables used for high field magnets It includes two new chapters each devoted to MgB<sub>2</sub> and Fe based superconductors and discusses the recently developed and world record setting 45.5 Tesla magnetic field generated by a combination of conventional and high temperature cuprate superconducting magnets In

addition it discusses the status and outlook of all current and future nuclear fusion reactors worldwide The chapter on accelerators includes the ongoing efforts to build high luminosity LHC HL LHC the high energy 28 TeV LHC HE LHC the future circular collider FCC at CERN and the just launched electro ion collider EIC at Brookhaven National Laboratory The book is based on the long standing experience of the author in studying superconducting materials building magnets and delivering numerous lectures to research scholars and students The book provides comprehensive and fundamental knowledge in the field of applied superconductivity greatly benefiting researchers and graduate students wishing to learn more about the various aspects of superconductivity and advanced magnet applications      **Physics** Art Hobson,2007 For a one semester course in liberal arts physics Hobson has four unifying themes How do we know the significance of post Newtonian physics modern physics energy and the social context of physics These themes become evident in the writing and pedagogy throughout the fourth edition      *Merrill Chemistry* Robert C.
