INTRODUCTION

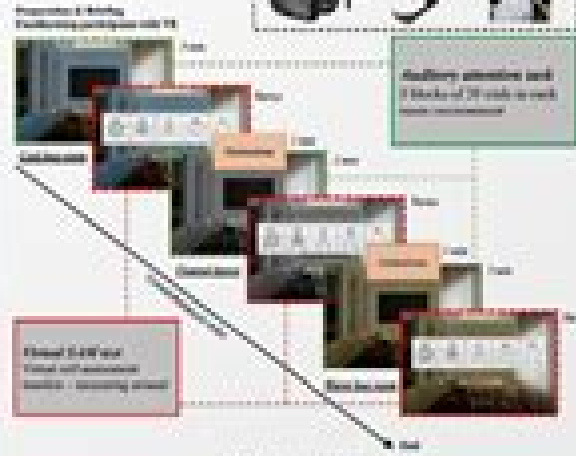

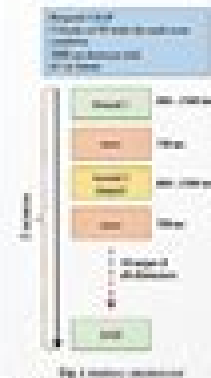

Indoor environments shape our cognitive perceptions and experiences, and architecture is a key factor in shaping the indoor environment. Architecture shapes the indoor environment, and the indoor environment shapes "what we see", physical health and performance (Chen et al., 2019). Studies have also shed light on the impact of design characteristics on users' cognitive functions and behavioral states for various purposes in public and domestic live applications. A positive indoor setting enhances creativity in a team environment, while productivity and performance in a office indoor environment, and a negative impact on cognitive performance in an indoor environment have also been reported in the existing literature. Various theories related to color have focused on the psychological properties of color, regarding the longer wavelengths (red) increase heart activity and shorter wavelengths (blue) result in a relaxing effect (Hirsh, 1987; Hirschman, 1980). While some studies have linked color to specific mood states (Kleinman et al., 2000), others suggest that color can affect cognitive performance (Kleinman et al., 2000). The following study aims to investigate the effect of color on cognitive performance in a virtual environment. The following study aims to investigate the effect of color on cognitive performance in a virtual environment.

HYPOTHESES

Based on the existing literature, the following hypotheses were formulated:
H1: Participants in a virtual indoor environment exposed to red color will show better performance in a higher RT in number of items.
H2: Participants in a virtual indoor environment exposed to blue color will show better performance in a lower RT in number of items.

MATERIALS AND METHODS

The proposed research involves the use of a virtual environment to study the effect of color on cognitive performance. The study was conducted in a virtual environment, and the results were compared with the results of a real-world study. The study was conducted in a virtual environment, and the results were compared with the results of a real-world study.

PROCEDURE

Local participants (aged 18-25) were recruited to study the effect of color on cognitive performance. They were divided into two groups: Red and Blue. The Red group was exposed to a red environment, and the Blue group was exposed to a blue environment. The study was conducted in a virtual environment, and the results were compared with the results of a real-world study.

RESULTS AND DISCUSSION

Based on the existing literature, it is expected that the virtual indoor environment exposed to red color will show better performance in a higher RT in number of items. The results of the study are presented in the following table.

The results of the study are presented in the following table. The Red condition shows a higher response time and a higher error rate compared to the Blue condition. The results of the study are presented in the following table.

CONTRIBUTIONS

The contributions of the study are as follows: First, the study provides a virtual environment for studying the effect of color on cognitive performance. Second, the study provides a real-world study for comparing the results of the virtual environment with the results of the real-world study.
