New Materialisms and Environmental Education David A. G. Clarke, Jamie McPhie, 2023-07-24 New materialisms refers to a broad contemporary and significant movement of thought across the social sciences and cultural studies which attempts to return to renew or create alternative philosophies of matter Such philosophies spring from multiple sources but are in general an attempt to bring the indissolubility of the social and environmental more forcefully into our analytical frames and modes of inquiry and tackle a perceived over reliance on

discourse and language in the so called post modern era of philosophy and social science This movement in thought is underlaid by and meets up with the climate and biodiversity crises and the nature of the human condition and modes of learning or becoming within the field of environmental education This volume brings together academics working at differing intersections of environmental education and new materialisms highlighting tensions knots and lines of flight across and for research practice and theory As such this collection draws on multiple interpretations and streams of thought within new materialisms and demonstrates their significance for those engaging with environmental education policy practice and research This book was originally published as a special issue of the journal Environmental Education Research

Report United Kingdom Atomic Energy Authority, 1978 **Tailoring visualization applications for tasks and users** Alexander Bock, 2018-05-21 Exponential increases in available computational resources over the recent decades have fueled an information explosion in almost every scientific field This has led to a societal change shifting from an information poor research environment to an over abundance of information As many of these cases involve too much information to directly

comprehend visualization proves to be an effective tool to gain insight into these large datasets While visualization has been used since the beginning of mankind its importance is only increasing as the exponential information growth widens the difference between the amount of gathered data and the relatively constant human ability to ingest information Visualization as a methodology and tool of transforming complex data into an intuitive visual representation can leverage the combined computational resources and the human cognitive capabilities in order to mitigate this growing discrepancy A large portion of visualization research is directly or indirectly targets users in an application domain such as medicine biology physics or others Applied research is aimed at the creation of visualization applications or systems that solve a specific problem within the domain Combining prior research and applying it to a concrete problem enables the possibility to compare and determine the usability and usefulness of existing visualization techniques These applications can only be effective when the domain experts are closely involved in the design process leading to an iterative workflow that informs its form and function These visualization solutions can be separated into three categories Exploration in which users perform an initial study of data Analysis in which an established technique is repeatedly applied to a large number of datasets and Communication in which findings are published to a wider public audience This thesis presents five examples of application development in finite element modeling medicine urban search rescue and astronomy and astrophysics For the finite element modeling an exploration tool for simulations of stress tensors in a human heart uses a compression method to achieve interactive frame rates In the medical domain an analysis system aimed at guiding surgeons during Deep Brain Stimulation interventions fuses multiple modalities in order to improve their outcome A second analysis application is targeted at the Urban Search Rescue community supporting the extraction of injured victims and enabling a more sophisticated decision making strategy For the astronomical domain first an exploration application enables the analysis of time varying volumetric plasma simulations to improving these simulations and thus better predict space weather A final system focusses on combining all three categories into a single application that enables the same tools to be used for Exploration Analysis and Communication thus requiring the handling of large coordinate systems and high fidelity rendering of planetary surfaces and spacecraft operations
