Michael Klemm, Jim Cownie, 2021-02-08 This book focuses on the theoretical and practical aspects of parallel programming systems for today's high performance multi core processors and discusses the efficient implementation of key algorithms needed to implement parallel programming models. Such implementations need to take into account the specific architectural aspects of the underlying computer architecture and the features offered by the execution environment. This book briefly reviews key concepts of modern computer architecture focusing particularly on the performance of parallel codes as well as the relevant concepts in parallel programming models. The book then turns towards the fundamental algorithms used to implement the parallel programming models and discusses how they interact with modern processors. While the book will focus on the general mechanisms we will mostly use the Intel processor architecture to exemplify the implementation concepts discussed but will present other processor architectures where appropriate. All algorithms and concepts are discussed in an easy to understand way with many illustrative examples, figures and source code fragments. The target audience of the book is students in Computer Science who are studying compiler construction, parallel programming or programming systems. Software developers who have an interest in the core algorithms used to implement a parallel runtime system or who need to educate themselves for projects that require the algorithms and concepts discussed in this book will also benefit from reading it.
