Step 1: Peroxyacid oxidation (requires isomerization of safrole) or **Wacker oxidation** (an elegant catalytic oxidation) produces the ketone "PMK" (piperonyl methyl ketone, also known as 3,4-MDP2P, or 3,4-methylenedioxyphenyl-2-propanone.) There are a lot of oxidization reactions available, but in this case we of course want something that will produce the **Markovnikov product**, with addition occurring at the more substituted end of the alkene. An initial oxidation to an alcohol followed by a second oxidation step to a ketone is also a possibility. Since safrole and PMK are carefully watched and regulated precursors, the current favorite precursor (typically bought from Chinese chemical manufacturers) is PMK glycidate. PMK glycidate can reportedly be easily broken down into PMK
