63. Though humans are the subject of intense genetic investigation, *Homo sapiens* are not generally considered a model genetic organism. Why not? Does this make sense?

ANSWER: Answers may vary. In some senses, the wealth of genetic information and studies concerning humans, the fact that the human genome has been sequenced, and the existence of experimental techniques to study humans provide similarities to model organisms. However, humans don't conform to true model organisms in terms of other experimentation advantages—short generation time, small size, inexpensiveness to propagate. Also, while natural, environmental, and substance-induced variations are studied in humans, experiments and studies must be set up within strong ethical guidelines and approvals not required for any other true model organism. The recognition of *Homo sapiens* as a distinct, separate form of life with an inherent dignity not common to other organisms prevents them from being classified as model organisms.
