(1) RNA (ribonucleic acid) is a type of nucleic acid that stores a temporary code of genetic information. The process of making proteins. The genetic information in DNA is transcribed into RNA, which is then translated into proteins in a process called the Central Dogma of Biology. It contains the code (instructions) that tell cells how to carry out a variety of important functions in the human body.

(2) Like DNA, RNA is composed of a long chain of nucleotides. However, unlike DNA, RNA is composed of a single strand instead of a double-stranded one, and contains the sugar ribose instead of deoxyribose. RNA can be a single-stranded chain (such as messenger RNA) or form a triple, or triple, and sometimes form other structures with itself and guarantee pairs with nucleotides.

(3) There are three main types of RNA, each with its own unique function:

- Messenger RNA (mRNA):** carries the genetic information from DNA in the nucleus for creating a complementary strand of protein from the code on the RNA strand. Once this strand carries that genetic information, it leaves the nucleus and carries the instructions for how proteins in the cytoplasm (ribosomes) in the cell.
- Transfer RNA (tRNA):** RNA molecules that carry the genetic information from mRNA into a specific sequence of amino acids, which are the basic building blocks of proteins. tRNA carries a specific amino acid to the ribosome and transfers it to the complementary genetic code on the mRNA.
- Ribosomal RNA (rRNA):** RNA is the site of protein synthesis and is a major component of ribosomes. Ribosomes join proteins and are found at the cytoplasm of a cell. Proteins are synthesized by joining amino acids to the growing chain in the ribosome.

DNA

(1) DNA (deoxyribonucleic acid) is a nucleic acid that stores the genetic information that is passed from parent to offspring. The structure, function, development, and transmission of all living organisms is written in the code on DNA. DNA is a double-stranded molecule in the shape of a double helix.

(2) Nucleotides are the building blocks of DNA. Each nucleotide consists of deoxyribose sugar, a phosphate group, and a nitrogenous base. The sugar and phosphate form the sugar-phosphate backbone, and the nitrogenous bases are the nitrogenous bases. Neighboring nucleotides bond together to form the sugar-phosphate backbone of DNA. There are four types of nitrogenous bases in DNA: adenine (A), guanine (G), cytosine (C), and thymine (T).

RNAi Gregory J. Hannon, 2003 In the past three years the use of double stranded RNA to silence gene activity has become widely and rapidly adopted RNA interference is highly specific and remarkably potent and it acts on cells and tissues far removed from the site of introduction The principles behind RNAi are just being uncovered but this laboratory technique has been applied effectively in a wide variety of animal and plant species Variations on RNAi are revolutionizing many approaches to experimental biology complementing traditional genetic technologies with a quicker and less expensive way of mimicking the effects of mutations both in cell cultures and in living animals Recent advances in the use of RNAi to engineer heritable silencing in mammals to alter stem cells for organ reconstitution and to alter the course of disease in model systems indicate that RNAi may have a future in disease therapy Written by pioneers in this new field and edited by Gregory Hannon one of its leading figures RNAi A Guide to Gene Silencing presents the principles of RNAi and reliable protocols for its laboratory use in *Caenorhabditis elegans* *Drosophila* plants avian embryos mammalian cells mouse oocytes and more This important and unique book is an essential laboratory resource for scientists studying gene regulation and for all experimental biologists interested in the emerging practical applications of RNAi

Biology: How Life Works (Volume 1) James Morris, 2013-01-04 Ordinarily textbooks are developed by first writing chapters then making decisions about art and images and finally once the book is complete assembling a test bank and ancillary media This process dramatically limits the integration across resources and reduces art media and assessments to ancillary material rather than essential resources for student learning Biology How Life Works is the first project to develop three pillars the text the visual program and the assessment at the same time All three pillars were developed in parallel to make sure that each idea is addressed in the most appropriate medium and to ensure authentic integration These three pillars are all tied to the same set of core concepts share a common language and use the same visual palette In this way the text visual program and assessments are integral parts of student learning rather than just accessories to the text
