Jack Pierce, 1975 *Genes, Information, and Semiosis* Charbel Niño El-Hani, João Queiroz, Claus Emmeche, 2009 Up to the middle of the 20th century biologists studied genes without seeing them as informational structures information theory was an engineering tool not dealing with the meaning of messages and semiotics the study of signs and their meaning dealt only with human culture Today after progress in molecular biology and a naturalist turn in general semiotics researchers are beginning to realize that genes information and semiosis or sign action can no longer be understood in isolation This insight derives from a new scientific field Biosemiotics investigates the meaning interpretation communication and habit formation of living systems and the biochemical conditions for sign action This book clarifies the information talk in molecular and systems biology by building a semiotic model of genes and protein synthesis It is consistent with the best scientific understanding and it is non reductionist integrating signs molecules and natural interpretation It offers a new definition of gene in biology and an understanding of information that does not reduce it to digital bits but sees it as related to the forms and processes of living organisms Readers not familiar with molecular biology or semiotics are provided with brief introductions to basic concepts The book is a challenge to entrenched beliefs in the anthropic nature of signs and the substantial nature of genes No scientific revolutions are offered but a set of deeper insights into an exciting new cross disciplinary perspective upon life and signs Publisher description
