CCEA GCSE Chemistry Nora Henry, Alyn G. McFarland, 2017-08-21 Build your students scientific thinking and practical skills with this textbook developed specifically for the 2017 GCSE specifications and from the No 1 publisher for CCEA GCSE Science Develop understanding with clear Examples Tips and Practical activities Prepare students for assessment with Test Yourself questions Maths practice and Exam style questions throughout Provides everything you need for GCSE Chemistry and the Chemistry content of GCSE Double Award Science Supports Foundation and Higher tier students in one book

GCSE Science Graham Hill, 1997 Intended for achieving examination success this series replaces the former GCSE Study Guides This book which are part of the new Revise GCSE series offers complete study and reference support for the Science GCSE course as well as being a revision guide for the Science GCSE examinations and Scottish Standard Grade It provides a breakdown of the syllabuses and exam structure for every exam board advice on studying revising coursework and exams topic by topic coverage clearly presented with many examples and diagrams quick tests for every topic to check progress and a bank of recent GCSE exam questions with answers to fine tune exam techniques The School Science Review , 2003

Environmental Education Benjamin Aldrich-Moodie, Jo Kwong, 1997 This original piece of research examines the teaching of environmental issues in the UK and US Looking at a variety of textbooks and how specific issues are taught they find that the teaching of the environment is characterised by bad science sloppy thinking and indoctrination **Food and Nutrition Quarterly Index** , 1987 Current Index to Journals in Education , 1990 Potential Alkali Reactivity of Carbonate Rock from Six Quarries Alan D. Buck, 1969 The Effect of Acid Additives on Carbonate Rock Wettability and Spent Acid Recovery in Low Permeability Gas Carbonates Mehrnoosh Saneifar, 2012 Spent acid retention in the near wellbore region causes reduction of relative permeability to gas and eventually curtailed gas production In low permeability gas carbonate reservoirs capillary forces are the key parameters that affect the trapping of spent acid in the formation Capillarity is a function of surface tension at the gas liquid interface and contact angle of the fluids in the rock To weaken capillary forces surface tension should be low and contact angle should be large This work provides a comprehensive study on the effect of various common acid additives on carbonate rock wettability and surface tension and contact angle as the main parameters that control capillarity Surface tension and contact angle experiments were conducted using Drop Shape Analysis DSA instrument at high temperature and pressure Core flood experiments were also conducted to study the overall impact of the acid additives on wettability by analyzing irreducible fluid saturation in the rocks before and after spent acid exposure Spontaneous water imbibition was conducted in each case to check for permanent or long term wettability change as a result of using these additives Acid additives such as methanol and corrosion inhibitors reduced both surface tension and contact angle Iron control agents had no impact on surface tension however they decreased contact angle at the lower concentration used Formic and acetic acids did not affect the surface tension but they had a reducing impact on the contact

angle According to the core flood experiment results formic acid decreased irreducible fluid saturation whereas methanol increased irreducible fluid saturation On the other hand the fluorochemical surfactant tested changed the rock wettability into more gas wetting Use of this chemical would help in recovering spent acid The results of the spontaneous water imbibition tests showed that organic acids and iron control chemicals did not have a permanent impact on wettability of the rocks However the wettability change as a result of using fluorochemical surfactant would persist for a long time as this chemical forms a film on the rock surface

Technical Methods of Ore Analysis Albert Howard Low, 1919 *Revision of MonC-209* A. F. Stehney, David N. Hume, 1950 **The Non-existence of Magnesium Carbonate in Humid Soils** Walter Hoge MacIntire, Luther George Willis, J. I. Hardy, 1914 *A New Organic Acid to Stimulate Deep Wells in Carbonate Reservoirs* Ahmad F Al-Douri, 2015 Carbonate acidizing has been carried out using HCl based stimulation fluids for decades However at high temperatures HCl does not produce acceptable results because of its fast reaction acid penetration and hence surface dissolution and its high corrosion rate As a result alternatives to HCl have been investigated including organic acids In this work the reaction of a new organic acid with calcite was investigated using the rotating disk apparatus and coreflood setup The organic acid was obtained using both a phosphorous based and iron based catalyst The rate of reaction of a 10 wt% solution of the new organic acid was measured using the rotating disk apparatus at temperatures up to 250 F Low permeability Indiana limestone 1 5 md samples of 1 5 in diameter and 0 75 in length were used The effect of disk rotational speed 100 1 500 rpm was investigated Samples of the reacted fluid were collected periodically and calcium and iron concentrations were measured using Inductively Coupled Plasma and used to determine the acid rock reaction rate and to study the possibility of precipitation Also coreflood experiments at different injection rates and a temperature of 300 F were performed to study the effect of the acid on wormhole propagation in calcite Low permeability Indiana limestone 1 10 md cores used in these experiments have a diameter of 1 5 in and a length of 6 in For the phosphorus based acid experimental results showed that the rate of calcite dissolution at 205 F was controlled only by the rate of mass transfer of the acid to the surface However at 250 F the reaction was controlled by both mass transfer and by the kinetics of the surface reaction At 205 F the reaction rate varied from 7 79E 07 to 4 47E 06 gmol cm² s while at 250 F the range was between 5 82E 07 and 2 72E 06 gmol cm² s In coreflood experiments the phosphorus based acid caused calcium phosphate precipitation at 300 F while the iron based acid achieved breakthrough Also the optimum injection rate of the iron based acid was determined to be 2 0 cm³ min This study summarizes the results obtained and recommends the use of the new organic acid for field applications in calcite reservoirs The electronic version of this dissertation is accessible from <http://hdl.handle.net/1969/1/152449>
