## Across

- [3] Charles Darwin went on a five year voyage about the \_\_\_\_\_.  
 [5] The process of change over time is called \_\_\_\_\_.  
 [7] Lamarck suggested that individual could pass \_\_\_\_\_ traits on to their offspring.  
 [9] According to the principle of common descent, all species living and extinct are descended from ancient common \_\_\_\_\_.  
 [10] An inherited characteristic that increases an organism's ability to survive and reproduce in its environment is called a/an \_\_\_\_\_.  
 [11] \_\_\_\_\_ dating indicates the Earth is about 4.5 billion years old.  
 [12] The preserved remains or traces of ancient organisms.  
 [13] A/an \_\_\_\_\_ structure is a structure that is inherited from ancestors but has lost much or all of its original function.  
 [15] Variation within a species increases the likelihood the species will survive environmental \_\_\_\_\_.  
 [19] Darwin noticed that different yet related animal species often occupied different \_\_\_\_\_ within a local area.  
 [21] Darwin published his theory on evolution in the book: On the Origin of \_\_\_\_\_.  
 [23] Members of a population must \_\_\_\_\_ to obtain food, living space, and other limited necessities of life.  
 [24] Darwin proposed that natural selection had shaped the \_\_\_\_\_ of different bird populations as they became adapted to eat different foods.

## Down

- [1] At the molecular level, the universal \_\_\_\_\_ code and homologous molecules provide evidence of common descent.  
 [2] During his travels, Darwin studied species on the \_\_\_\_\_ islands.  
 [4] Structures that are shared by related species and that have been inherited from a common ancestor are called \_\_\_\_\_ structures.  
 [6] The difference between individual in a species is called \_\_\_\_\_.  
 [8] Body parts that share a common function, but not structure are called \_\_\_\_\_ structures.  
 [10] In \_\_\_\_\_ selection, nature provides the variation, and humans select those they find useful.  
 [12] The french naturalist \_\_\_\_\_ suggested that organisms could change during their lifetimes by selectively using or not using various parts of their bodies.  
 [14] Economist Thomas \_\_\_\_\_ reasoned that if human population grew unchecked, there wouldn't be enough living space and food for everyone.  
 [16] The Grants have documented that natural selection takes place in wild \_\_\_\_\_ populations frequently and sometimes rapidly.  
 [17] Darwin described the competition for limited resources as the struggle for \_\_\_\_\_.  
 [18] \_\_\_\_\_ selection is the process by which organisms with variations most suited to their local environment survive and leave more offspring.  
 [20] \_\_\_\_\_ describes how well an organism can survive and reproduce in its environment.

**Species** Charles Darwin,2024-12-15 The Origin of Species presents Charles Darwin s theory of evolution through natural selection unveiling the mechanisms by which species adapt and change over generations On the Origin of Species By Means of Natural Selection: A Quick Read edition Quick Read,Charles Darwin,2024-02-16 Discover a new way to read classics with Quick Read This Quick Read edition includes both the full text and a summary for each chapter Reading time of the complete text about 14 hours Reading time of the summarized text 14 minutes On the Origin of Species by Charles Darwin was a groundbreaking book that presented the theory of evolution through natural selection Published in the mid 19th century it challenged the prevailing beliefs of the time that species were fixed and created by God Darwin argued that species evolved over time through a process of adaptation and survival of the fittest The book faced initial resistance from the scientific establishment which was closely tied to the Church of England However within two decades there was widespread acceptance of evolution among scientists Darwin s theory was based on observations of the natural world including the fossil record and geographical distribution of species The book also addressed objections to the theory such as the lack of intermediate forms and the complexity of certain organs Despite initial controversy On the Origin of Species had a profound impact on the scientific community and paved the way for further research in the field of evolutionary biology

*On the Origin of Species* Charles Darwin,Murat Ukray,2014-09-14 On the Origin of Species published on 24 November 1859 is a work of scientific literature by Charles Darwin which is considered to be the foundation of evolutionary biology Its full title was On the Origin of Species by Means of Natural Selection or the Preservation of Favoured Races in the Struggle for Life For the sixth edition of 1872 the short title was changed to The Origin of Species Darwin s book introduced the scientific theory that populations evolve over the course of generations through a process of natural selection It presented a body of evidence that the diversity of life arose by common descent through a branching pattern of evolution Darwin included evidence that he had gathered on the Beagle expedition in the 1830s and his subsequent findings from research correspondence and experimentation Various evolutionary ideas had already been proposed to explain new findings in

biology There was growing support for such ideas among dissident anatomists and the general public but during the first half of the 19th century the English scientific establishment was closely tied to the Church of England while science was part of natural theology Ideas about the transmutation of species were controversial as they conflicted with the beliefs that species were unchanging parts of a designed hierarchy and that humans were unique unrelated to other animals The political and theological implications were intensely debated but transmutation was not accepted by the scientific mainstream The book was written for non specialist readers and attracted widespread interest upon its publication As Darwin was an eminent scientist his findings were taken seriously and the evidence he presented generated scientific philosophical and religious discussion The debate over the book contributed to the campaign by T H Huxley and his fellow members of the X Club to secularise science by promoting scientific naturalism Within two decades there was widespread scientific agreement that evolution with a branching pattern of common descent had occurred but scientists were slow to give natural selection the significance that Darwin thought appropriate During the eclipse of Darwinism from the 1880s to the 1930s various other mechanisms of evolution were given more credit With the development of the modern evolutionary synthesis in the 1930s and 1940s Darwin s concept of evolutionary adaptation through natural selection became central to modern evolutionary theory and it has now become the unifying concept of the life sciences

**Summary of Darwin s theory** Darwin s theory of evolution is based on key facts and the inferences drawn from them which biologist Ernst Mayr summarised as follows Every species is fertile enough that if all offspring survived to reproduce the population would grow fact Despite periodic fluctuations populations remain roughly the same size fact Resources such as food are limited and are relatively stable over time fact A struggle for survival ensues inference Individuals in a population vary significantly from one another fact Much of this variation is inheritable fact Individuals less suited to the environment are less likely to survive and less likely to reproduce individuals more suited to the environment are more likely to survive and more likely to reproduce and leave their inheritable traits to future generations which produces the process of natural selection inference This slowly effected process results in populations changing to adapt to their environments and ultimately these variations accumulate over time to form new species inference

**On the Origin of Species** Charles Darwin,2016-02-22 **INTRODUCTION** When on board H M S Beagle as naturalist I was much struck with certain facts

in the distribution of the inhabitants of South America and in the geological relations of the present to the past inhabitants of that continent These facts seemed to me to throw some light on the origin of species that mystery of mysteries as it has been called by one of our greatest philosophers On my return home it occurred to me in 1837 that something might perhaps be made out on this question by patiently accumulating and reflecting on all sorts of facts which could possibly have any bearing on it After five years work I allowed myself to speculate on the subject and drew up some short notes these I enlarged in 1844 into a sketch of the conclusions which then seemed to me probable from that period to the present day I have steadily pursued the same object I hope that I may be excused for entering on these personal details as I give them to show that I have not been hasty in coming to a decision My work is now nearly finished but as it will take me two or three more years to complete it and as my health is far from strong I have been urged to publish this Abstract I have more especially been induced to do this as Mr Wallace who is now studying the natural history of the Malay archipelago has arrived at almost exactly the same general conclusions that I have on the origin of species Last year he sent to me a memoir on this subject with a request that I would forward it to Sir Charles Lyell who sent it to the Linnean Society and it is published in the third volume of the Journal of that Society Sir C Lyell and Dr Hooker who both knew of my work the latter having read my sketch of 1844 honoured me by thinking it advisable to publish with Mr Wallace s excellent memoir some brief extracts from my manuscripts I much regret that want of space prevents my having the satisfaction of acknowledging the generous assistance which I have received from very many naturalists some of them personally unknown to me I cannot however let this opportunity pass without expressing my deep obligations to Dr Hooker who for the last fifteen years has aided me in every possible way by his large stores of knowledge and his excellent judgment In considering the Origin of Species it is quite conceivable that a naturalist reflecting on the mutual affinities of organic beings on their embryological relations their geographical distribution geological succession and other such facts might come to the conclusion that each species had not been independently created but had descended like varieties from other species Nevertheless such a conclusion even if well founded would be unsatisfactory until it could be shown how the innumerable species inhabiting this world have been modified so as to acquire that perfection of structure and coadaptation which most justly excites our admiration Naturalists continually refer to external conditions such as climate food etc as the only possible cause of variation In one very limited sense as we shall hereafter see this may be true but it is preposterous to attribute to mere external conditions the structure for instance of the woodpecker with its feet tail beak and tongue so admirably adapted to catch insects under the bark of trees In the case of the misseltoe which draws its nourishment from certain trees which has seeds that must be transported by certain birds and which has flowers with separate sexes absolutely requiring the agency of certain insects to bring pollen from one flower to the other it is equally preposterous to account for the structure of this parasite with its relations to several distinct organic beings by the effects of external conditions or of habit or of the volition of the plant itself The author of the

Vestiges of Creation would I presume say that after a certain unknown number of generations some bird had given birth to a woodpecker and some plant to the misseltoe and that these had been produced perfect as we now see them but this assumption seems to me to be no explanation for it leaves the case of the coadaptations of organic beings to each other and to their physical conditions of life untouched and unexplained      On the Origin of Species Illustrated Charles Darwin,2020-11-25 On the Origin of Species or more completely On the Origin of Species by Means of Natural Selection or the Preservation of Favoured Races in the Struggle for Life 3 published on 24 November 1859 is a work of scientific literature by Charles Darwin which is considered to be the foundation of evolutionary biology 4 Darwin s book introduced the scientific theory that populations evolve over the course of generations through a process of natural selection It presented a body of evidence that the diversity of life arose by common descent through a branching pattern of evolution Darwin included evidence that he had gathered on the Beagle expedition in the 1830s and his subsequent findings from research correspondence and experimentation      **On the Origin of Species Annotated Book with Teacher Edition** Charles Darwin,2020-08-22 Darwin addresses some of the flaws in his theory of natural selection He tackles two major questions First if species have gradually descended from other species why do clearly defined separate species exist instead of numerous intermediate forms of species Second can natural selection really produce highly complex organs such as the eye from species lacking anything remotely similar to such complex organs To answer the first question Darwin argues that natural selection requires that intermediate varieties become extinct Since natural selection urges species to become perfectly adapted to their environments certain environments favor some characteristics and other environments favor others allowing species to diverge based on their separate environments The favored characteristics in these respective environments would become more advantageous than any intermediate characteristics causing the intermediate species to become extinct Darwin addresses the question of whether an intermediate species would exist in an intermediate geological area between the two different environments He argues that intermediate environments are so geographically small that intermediate species in those areas would not be able to reproduce sufficiently to perpetuate themselves and survive and would eventually become extinct Therefore we only see small numbers of intermediate species in these intermediate geographical zones Darwin is not as confident about the answer to his second question as he is about the answer to his first He admits that it is difficult to explain how new structures such as the wings of a bat are created when a species descends from one that lacks such structures He does give examples from other species in which modifications develop from existing structures instead of sprouting anew such as the species of flying squirrels with broad tails that allow them to parachute through the air a tail modified from existing tails in other squirrel species He also explains that scientists are unable to see a clear line of organ modification because of gaps in the development of these structures for example squirrel tails that are not yet fully adapted for flying These gaps come about when the intermediate species have become extinct Examples of

explainable models such as the flying squirrel's tail can help an observer imagine the development of more complex organs such as the wings of the bat or the eye. Over time, gradual developments of structures and nerves become more complex with modifications until finally the most perfect eye organ develops. Darwin compares the eye to a telescope. Over time and through its development, the telescope has become more and more advanced, replacing older versions. While the mechanism of change for the telescope is technological advancement, for the eye, it is natural selection.

**The Origin of Species (100 Copy Collector's Edition)** Charles Darwin, 2019-12-03. The Origin of Species is a work of scientific literature by Charles Darwin which is considered to be the foundation of evolutionary biology. Darwin's book introduced the scientific theory that populations evolve over the course of generations through a process of natural selection. It presented a body of evidence that the diversity of life arose by common descent through a branching pattern of evolution. Darwin included evidence that he had gathered on the Beagle expedition in the 1830s and his subsequent findings from research, correspondence, and experimentation. The Origin of Species attracted widespread interest upon its publication. As Darwin was an eminent scientist, his findings were taken seriously, and the evidence he presented generated scientific, philosophical, and religious discussion. Within two decades, there was widespread scientific agreement that evolution with a branching pattern of common descent had occurred. In the 1930s and 1940s, Darwin's concept of natural selection became central to modern evolutionary theory, and it has now become the unifying concept of the life sciences. This cloth-bound book includes a Victorian-inspired dust jacket and is limited to 100 copies.
