This section tells about the experiments that helped scientists discover the relationship between genes and DNA. It also describes the chemical structure of the DNA molecule.

Griffith and Transformation (pages 287-289)

1. What did Frederick Griffith want to learn about bacteria? He wanted to learn how certain types of bacteria produce pneumonia.
2. The strain of bacteria that caused pneumonia grew into smooth colonies on culture plates; harmless bacteria produced colonies with rough edges.
3. Circle the letter of each sentence that is true about Griffith's experiment.
 - ☒ a. Mice injected with bacteria from smooth colonies died.
 - ☐ b. Mice injected with bacteria from rough colonies died.
 - ☐ c. Mice injected with heat-killed bacteria from smooth colonies died.
 - ☒ d. Mice injected with a mixture of bacteria from heat-killed smooth colonies and live rough colonies died.
4. What result from Griffith's experiment suggested that the cause of pneumonia was not a chemical poison released by the disease-causing bacteria? The mice survived after being injected with heat-killed disease-causing bacteria.
5. What is transformation? It is the process by which one strain of bacteria changes into another.
6. What hypothesis did Griffith form from the results of his experiments? Some factor, which might be a gene, was transferred from the heat-killed bacteria cells into the live cells.

Avery and DNA (page 289)

7. Is the following sentence true or false? Avery and his colleagues thought that the molecule required in transformation might also be the molecule of the gene.
true
8. Briefly describe how Avery and his group determined which molecule was most important for transformation? They treated the extract of heat-killed bacteria with enzymes that destroyed proteins, lipids, carbohydrates, and other molecules, including RNA and DNA.

A New Kind of Computational Biology Parimal Pal Chaudhuri, Soumyabrata Ghosh, Adip Dutta, Somshubhro Pal Choudhury, 2018-09-26 This book reflects more than three decades of research on Cellular Automata CA and nearly a decade of work on the application of CA to model biological strings which forms the foundation of A New Kind of Computational Biology pioneered by the start up CARLBio After a brief introduction on Cellular Automata CA theory and functional biology it reports on the modeling of basic biological strings with CA starting with the basic nucleotides leading to codon and anti codon CA models It derives a more involved CA model of DNA RNA the entire translation process for amino acid formation and the evolution of protein to its unique structure and function In subsequent chapters the interaction of Proteins with other bio molecules is also modeled The only prior knowledge assumed necessary is an undergraduate knowledge of computer programming and biology The book adopts a hands on do it yourself approach to enable readers to apply the method provided to derive the CA rules and comprehend how these are related to the physical rules observed in biology In a single framework the authors have presented two branches of science Computation and Biology Instead of rigorous molecular dynamics modeling which the authors describe as a Bottoms Up model or relying on the Top Down new age Artificial Intelligence AI and Machine Language ML that depends on extensive availability of quality data this book takes the best from both the Top Down and Bottoms up approaches and establishes how the behavior of complex molecules is represented in CA The CA rules are derived from the basic knowledge of molecular interaction and construction observed in biological world but mapped to a few subset of known results to derive and predict results This book is useful for students researchers and industry practitioners who want to explore modeling and simulation of the physical world complex systems from a different perspective It raises the inevitable the question Are life and the universe nothing but a collection of continuous systems processing information
