

CHAPTER 1

Psychological disorder or abnormal behavior

- It is a psychological dysfunction within an individual that is associated with distress or impairment in functioning and a response that is not typical or culturally expected

Criteria:

- Psychological dysfunction
- Distress or impairment
- Atypical response

Example: Judy- patient that has a blood injection-injury phobia. Frog dissection in biology class triggered her phobia with lightheaded feeling. It haunted her and made her faint 5 to 10 times a week. (Phobia is a psychological disorder characterized by marked and persistent fear of an object or situation.)

Psychological dysfunction - refers to a breakdown in cognitive, emotional, or behavioral functioning.

That the behavior must be associated with **distress** to be classified as abnormal adds an important component and seems clear: the criterion is satisfied if the individual is extremely upset.

The concept of **impairment** is useful, although not entirely satisfactory. For example, many people consider themselves shy or lazy. This doesn't mean that they're abnormal. But if you are so shy that you find it impossible to date or even interact with people and you make every attempt to avoid interactions even though you would like to have friends, then your social functioning is impaired. (Impairment is any loss or abnormality of psychological, physiological or anatomical structure or function.(own search))

Atypical or Not Culturally Expected- At times, something is considered abnormal because it occurs infrequently; it deviates from the average. The greater the deviation(the action of departing from an established course or accepted standard), the more abnormal it is.

The most widely accepted definition used in DSM-5 describes behavioral, psychological, or biological dysfunctions that are unexpected in their cultural context and associated with present distress and impairment in functioning, or increased risk of suffering, death, pain, or impairment.
