

The REV10... is a mains-independent unit. It is powered by two 1.5 V alkaline batteries. The controller is supplied with the batteries. In order to prevent unintended operation of the controller, a paper battery transit tab is inserted. The REV10 is a microprocessor based controller using a potential-free contact as an output relay. This measuring element is an NTC resistor. A reserve of approx. 30 s ensures the stored data will be retained while the batteries are replaced.

The unit is to be mounted on an inner wall of the reference room, about 1.50 m above the floor. Not in niches, shelves, behind curtains and doors, not near heat sources, and not exposed to direct solar radiation.

The controller is supplied complete with mounting instructions. For remote operation, a separate cable must be used (shielded, if available).

Before commissioning the plant, the wiring to the regulating unit is to be checked and a functional test carried out.

For safety reasons, the following instructions must be observed during operation of the unit during transport and storage, must be removed.

The control mode of the R67V0... can be changed by means of a switch located at the rear of the unit.

- The standard position, providing PID control with a cycle time of 12 minutes, covers the majority of applications
- If the space temperature fluctuates too much, the cycle time can be reduced to 6 minutes by operating the switch
- For extremely difficult control systems, the position "on/off control with P control" can be used.

In the reference room, the thermostatic radiator valves must be blocked in their fully open position.
