Ecosystems and Restoration Ecology

A. Figure 55.1 Why is this Antarctic ice blood red?

KEY CONCEPTS

- 55.1** Physical laws govern energy flow and chemical cycling in ecosystems
- 55.2** Energy and other limiting factors control primary production in ecosystems
- 55.3** Energy transfer between trophic levels is typically only 10% efficient
- 55.4** Biological and geochemical processes cycle nutrients and water in ecosystems
- 55.5** Restoration ecologists help return degraded ecosystems to a more natural state

OVERVIEW

Cool Ecosystem

Three hundred meters below Taylor Glacier, in Antarctica, an unusual community of bacteria lives on sulfur- and iron-containing ions. These organisms thrive in harsh conditions, without light or oxygen and at a temperature of

-10°C , so low that the water would freeze if it weren't three times as salty as the ocean. How has this community survived, isolated from Earth's surface for at least 1.5 million years? The bacteria are chemosynthetic, which obtain energy by oxidizing sulfur taken up from their sulfate-rich environment (see Chapter 27). They use iron as a final electron acceptor in their reactions. When the water flows from the base of the glacier and comes into contact with air, the reduced iron in the water is oxidized and turns red before the water freezes. The distinctive color gives this area of the glacier its name—Blood Falls (**Figure 55.1**).

Together, the bacterial community and surrounding environment make up an **ecosystem**, the sum of all the organisms living in a given area and the abiotic factors with which they interact. An ecosystem can encompass a vast area, such as a lake or forest, or a microcosm, such as the space under a fallen log or a desert spring (**Figure 55.2**). As with populations and communities, the boundaries of ecosystems are not always discrete. Many ecologists view the entire biosphere as a global ecosystem, a composite of all the local ecosystems on Earth.

Regardless of an ecosystem's size, its dynamics involve two processes that cannot be fully described by population or community phenomena: energy flow and chemical cycling. Energy enters most ecosystems as sunlight. It is converted to chemical energy by autotrophs, passed to heterotrophs in the organic compounds of food, and dissipated as heat. Chemical elements, such as carbon and nitrogen, are cycled among abiotic and biotic components of the ecosystem. Photosynthetic and chemosynthetic organisms assimilate these elements in inorganic form from the air, soil, and water and incorporate them into their biomass, some of which is consumed by animals. The elements are returned in inorganic form to the environment by the metabolism of plants and animals and by organisms such as bacteria and fungi that break down organic wastes and dead organisms.

Both energy and matter are transformed in ecosystems through photosynthesis and feeding relationships. But unlike matter, energy cannot be recycled. An ecosystem must be powered by a continuous influx of energy from an external source—in most cases, the sun. Energy flows through ecosystems, whereas matter cycles within and through them.

Resources critical to human survival and welfare, ranging from the food we eat to the oxygen we breathe, are products of ecosystem processes. In this chapter, we will explore the dynamics of energy flow and chemical cycling, emphasizing the results of ecosystem experiments. One way to study ecosystem processes is to alter environmental factors, such as temperature or the abundance of nutrients, and study how ecosystems respond. We will also consider some of the impacts of human activities on energy flow and chemical cycling. Finally, we will explore the growing science of restoration ecology, which focuses on returning degraded ecosystems to a more natural state.

Introduction To The Biology Of Marine Life John Morrissey, James L. Sumich, Deanna R. Pinkard-Meier, 2016-11-01
Introduction to the Biology of Marine Life is an introductory higher education textbook for students with no prior knowledge of marine biology. The book uses selected groups of marine organisms to provide a basic understanding of biological principles and processes that are fundamental to sea life. *Assessment of grassland ecosystem conditions in the southwestern United States*, 2004

between the diversity of plant and animal species and host dependent agricultural systems. Biodiversity in Agroecosystems shows how biodiversity can be thought of not only as the rich make up of a great number of related and competing species within an ecologically defined community but also as the robust behavior and resilience of those species over time and as the endurance of their eco community. This book brings to the fore new research on biodiversity in agricultural ecosystems at both micro and macro levels heretofore available only in journals and proceedings papers.

Physical and Biological Guidelines for Beach Restoration Projects Walter G. Nelson, 1985
Several studies have been undertaken to describe the sand beach fauna which have been divided into 3 zones although terminology has varied. There have been reported striking similarities in the types of organisms inhabiting sandy beaches in various locations. The degree of wave exposure as well as the environment of the beach and the coarseness of the sand appear to be major factors controlling the diversity of sand beach communities. The biology of selected organisms includes Emerita talpoida, mole crabs, Domax spp, coquina clams, Haustoriid Amphipods, Surf zone fishes, Ocyropsis quadrata, ghost crab, Polychaetes, and Sea turtles. Most of the studies reported little or no long term adverse effects of beach nourishment. The effects of beach nourishment were reported similar to the effects of storm events. Experimental sediment burial studies were carried out on the intertidal organisms with the results shown in Table VIII. The results were dependent upon the coarseness and depth of the sediment. Recommendations included a general review of data on the effects of beach nourishment on sand beach macrofauna suggests that minimal biological effects result. Some mortality of organisms may occur when grain size is a poor match to existing sediments. recovery of the beach system appears to be rapid. Turtle nesting may be negatively affected due to sand compaction for about

one year Further biological monitoring should be continued until more data is available Nourishment sand should match natural sand as closely as possible in size distribution and chemical characteristics The upper beach should be plowed following nourishment to counteract compaction in turtle nesting areas Avoid covering dune vegetation with sand Try to avoid nourishment during turtle nesting if this is not possible relocate turtle nests Biological monitoring techniques should be standardized according to specific guidelines
