This is a detailed, clear, simple, and interesting academic and intellectual trip into neurons, axons, synapses, and their bases in memory formation and learning. The author goes after the origin of his first primordial memory in an attempt to find and nurture his own identity and personality. Memories can be categorized as working memory, short-term memory, and long-term memory. In addition, we have conscious, unconscious, toxic, automatic, and uncategorized memory, such as adoptive memory in the immune system, puzzling but challenging memory during matching nucleotides and amino acids, T cells memory recognize, identify, and destroy pathogens among billions of cells, genes, and proteins packaging for self-protection and function. Long-term unconscious memory is just the tip of the iceberg when it comes to cognitive memory. Further exploring his initial objective, the primordial memory, the author encounters the electrical and chemical reactions coming under the domain of genes without ignoring DNA. Last but not least is memory of love from birth till death. It is encoded in a memory that encompasses my whole body. **Using the Biological Literature** Diane Schmidt, 2014-04-14.
