Botanical Gardens and Their Role in Plant Conservation T. Pullaiah, David A. Galbraith, 2023-09-29 Approaching the contributions of a world wide sector of scientific institutions to addressing the extinction crisis Botanical Gardens and Their Role in Plant Conservation brings together a diversity of perspectives There are more than 3 600 botanical gardens worldwide where trees shrubs herbs and other plants are studied and managed in collections They are foremost among efforts to conserve the diversity of living plant species and ensure that crucial biodiversity is available for the future of humanity This book is a showcase for plant conservation restoration biodiversity and related scientific and educational work of botanical gardens around the world featuring both thematic overview chapters and numerous case studies that illustrate the critical role these institutions play in fighting extinction and ensuring plant diversity is available for sustainable use FEATURES A wide range of case studies derived from practical experience in a diversity of institutional national and biogeographical settings Reviews of topics such as networking amongst institutions the importance of global policy agreements such as the Convention on Biological Diversity and the Global Strategy for Plant Conservation Profiles of botanical gardens contributions at the national level to conservation priorities Real world examples of programs in plant conservation for both critically endangered wild plant diversity and unique horticultural or cultural germplasm Botanical

Gardens and Their Role in Plant Conservation includes contributions from institutions from Africa Asia Australia Europe and the Americas and institutions of all sizes and histories from long established national gardens to new gardens offering their perspectives on developing their roles in this vital undertaking [Linking Habitat Quality to Population Dynamics for Conservation Decision Making](#) David R. Breininger, Doug P. Armstrong, Robert C. Lacy, James Nichols, 2025-04-09 Endangered Species Recovery planning is often based on predictions from population models Species recovery is contingent on habitat restoration including reduction of threats such as predators and parasites However population predictions are rarely linked to habitat management meaning that management cannot be easily guided by most formal decision making frameworks Predicted recovery trajectories may depend not only on the type and extent of restoration but also the timing For example populations may initially continue to decline as habitat restoration takes place and their genetic diversity might need to be maintained during that process There is also often considerable uncertainty about the effectiveness of proposed management in improving habitat quality and the effects of those improvements on population growth rates of the species targeted for recovery We seek examples of approaches integrating habitat restoration and population dynamics to guide decision making One example is where population data e g occupancy and habitat dynamics e g transition probabilities between states are directly integrated into a statistical likelihood Another uses a metamodel to combine different interdisciplinary models e g population habitat disease predator prey to represent a more complex system integrating the flow of information and sequences of events among models Decision frameworks to enhance species recovery could include management of relatively natural areas but also more intensively managed areas such as zoos or fragmented landscape with minimal long term conservation potential for some species Decision frameworks will ideally include adaptive management i e re current decisions recognizing that conservation decisions often need to begin imminently and that delaying action is a decision We invite articles that include several of the following elements in the context of conservation decision making Explaining why it is important to consider animal or plant population and habitat dynamics together Case studies models or other demonstrations of how habitat and population dynamics should or can be linked Examples may include remnant populations but also recent or prospective translocations Explicit or decision making approaches including adaptive management for linking habitat and populations for conservation to guide conservation Showing how loss of genetic variation in small populations can affect decisions given the time needed to restore habitat reduced toxins introduced predators disease Showing how variation in population and habitats over time and or space are important for decisions about species recovery [Monthly Catalogue, United States Public Documents](#) ,1994-12 [Optimizing the Delivery of Multiple Ecosystem Goods and Services in Agricultural Systems](#) Maria A. Tsiafouli, Evangelia G. Drakou, Alberto Orgiazzi, Katarina Hedlund, Karl Ritz, 2017-10-18 Agricultural land is subjected to a variety of societal pressures as demands for food animal feed and biomass production increase with an added requirement to simultaneously maintain natural areas and mitigate climatic and

environmental impacts The biotic elements of agricultural systems interact with the abiotic environment to generate a number of ecosystem functions that offer services benefiting humans across many scales of time and space The intensification of agriculture generally reduces biodiversity including that within soil and impacts negatively upon a number of regulating and supporting ecosystem services There is a global need toward achieving sustainable agricultural systems as also highlighted in the United Nations Sustainable Development Goals There is hence a need for management regimes that enhance both agricultural production and the associated provision of multiple ecosystem services The articles of this Research Topic enhance our knowledge of how management practices applied to agricultural systems affect the delivery of multiple ecosystem services and how trade offs between provisioning regulating and supporting services can be handled both above and below ground They also show the diversity of topics that need to be considered within the framework of ecosystem services delivered by agricultural systems from knowledge on basic concepts and newly proposed frameworks to a focus on specific ecosystem types such as grasslands and high nature value farmlands pollinator habitats and soil habitats This diversity of topics indicates the need for broader scope research integrated with targeted scientific research to promote sustainable agricultural practices and to ensure food security
