Key Points

1. The diversity of life on the planet has been created through the process of evolution by means of natural selection. Differences between or within species is called **biodiversity**.
2. Through natural selection, organisms have evolved to lessen competition, and therefore fill a wide array of niches. This *biodiversity* increases the stability of ecosystems.
3. Biodiversity has important benefits to mankind, including development of new **food** sources and **medicines**; as providing **aesthetic** beauty. Ecosystem destruction leads to the loss of genetic biodiversity and increases the chance that an ecosystem will become **less** stable and collapse.

Procedures

*Safety precautions for the lab include goggles in step 4 & 5 for vinegar and baking soda and paper chromatography using food coloring, vinegar, and water.

1. Seven tests are conducted to determine the relatedness of Samples X,Y, and Z to *Botana curus*. They are as follows:
 - a. Structural Characteristics of Plants
 - b. Structural Characteristics of Seeds
 - c. Structural Characteristics of Stems (Internal Microscopic Structures)
Examine cross sections of the stems. Look for a **scattered** arrangement of bundles or a **circular** arrangement of bundles.
