

## Chapter 1.1 Components of a Computer System and Modes of Use.

### 1.1 (a and b) Hardware and Software Definitions

A computer system consists of hardware and software.

The hardware is the physical part of the system. All computer systems require at least four types of hardware.

- An input device is any piece of hardware that allows data to be transmitted to the computer processor. No computer, however powerful, is of value unless it is possible to give it instructions and also data to be used when those instructions are carried out.
- An output device is any piece of hardware that allows the computer processor to convey information, or the results of its processing. There is no point in having a computer system carrying out processing of any sort unless the results of that processing can be either reported, or used to effect future input to the system.
- Storage is any piece of hardware which can store data outside the processor in a form which is suitable for input back to the processor. This is necessary because data must be saved for future use if the processor is switched off and for transfer from one machine to another.

Descriptions of the basic hardware types will be given in Chapter 1.4.

The software of a computer system is the various sets of instructions which tell the system how to do things. These sets of instructions are collected together in workable groups known as programs. Without programs of instructions computers would not be able to function because they would not know what to do.
