Computational Linear and Commutative Algebra Martin Kreuzer, Lorenzo Robbiano, 2016-09-06 This book combines in a novel and general way an extensive development of the theory of families of commuting matrices with applications to zero dimensional commutative rings primary decompositions and polynomial system solving It integrates the Linear Algebra of the Third Millennium developed exclusively here with classical algorithmic and algebraic techniques Even the experienced reader will be pleasantly surprised to discover new and unexpected aspects in a variety of subjects including eigenvalues and eigenspaces of linear maps joint eigenspaces of commuting families of endomorphisms multiplication maps of zero dimensional affine algebras computation of primary decompositions and maximal ideals and solution of polynomial systems This book completes a trilogy initiated by the uncharacteristically witty books *Computational Commutative Algebra 1* and *2* by the same authors The material treated here is not available in book form and much of it is not available at all The authors continue to present it in their lively and humorous style interspersing core content with funny quotations and tongue in cheek explanations

Analytic Combinatorics in Several Variables Robin Pemantle, Mark C. Wilson, Stephen Melczer, 2024-02-15 Discrete structures model a vast array of objects ranging from DNA sequences to internet networks The theory of generating functions provides an algebraic framework for discrete structures to be enumerated using mathematical tools This book is the result of 25 years of work developing analytic machinery to recover asymptotics of multivariate sequences from their generating functions using multivariate methods that rely on a combination of analytic algebraic and topological tools The resulting theory of analytic combinatorics in several variables is put to use in diverse applications from mathematics combinatorics computer science and the natural sciences This new edition is even more accessible to graduate students with many more exercises computational examples with Sage worksheets to illustrate the main results updated background material additional illustrations and a new chapter providing a conceptual overview

Algebraic Integrability of Nonlinear Dynamical Systems on Manifolds A.K. Prykarpatsky, I.V. Mykytiuk, 2013-04-09 In recent times it has been stated that many dynamical systems of classical mathematical physics and mechanics are endowed with symplectic structures given in the majority of cases by Poisson brackets Very often such Poisson structures on corresponding manifolds are canonical which gives rise to the possibility of producing their hidden group theoretical essence for many completely integrable dynamical systems It is a well understood fact that great part of comprehensive integrability theories of nonlinear dynamical systems on manifolds is based on Lie algebraic ideas by means of which in particular the classification of such compatibly bi Hamiltonian and isospectrally Lax type integrable systems has been carried out Many chapters of this book are devoted to their description but to our regret so far the work has not been completed Hereby our main goal in each analysed case consists in separating the basic algebraic essence responsible for the complete integrability and which is at the same time in some sense universal i e characteristic for all of them Integrability analysis in the framework of a gradient holonomic

algorithm devised in this book is fulfilled through three stages 1 finding a symplectic structure Poisson bracket transforming an original dynamical system into a Hamiltonian form 2 finding first integrals action variables or conservation laws 3 defining an additional set of variables and some functional operator quantities with completely controlled evolutions for instance as Lax type representation
