Thomas, 1997 **The Journal of Business Forecasting Methods & Systems**, 1991 **The Five Biggest Unsolved Problems in Science** Arthur W. Wiggins, Charles M. Wynn, 2003-09-12 An in-depth look at the most intriguing puzzles in science today. In this illuminating book, professors Arthur Wiggins and Charles Wynn explore what they believe are the five biggest science problems: Physics: Why do some particles have mass while others have none? Chemistry: By what series of chemical reactions did atoms form the first living things? Biology: What is the complete structure and function of the proteome? Geology: Is accurate long-range weather forecasting possible? Astronomy: Why is the universe expanding faster and faster? Wiggins and Wynn carefully explain each of these problems, then discuss the theories that address them. Some of the many topics covered include string theory, the human genome, chaos theory, and protein folding. Featuring humorous illustrations from renowned science cartoonist Sidney Harris, this book invites you to explore the events that led to these problems and the cutting-edge efforts being made to solve them. The authors also provide Idea Folders which contain additional details about the unsolved problems and Resources for Digging Deeper such as books, periodicals, and Web sites.

Occasional Papers on the Irish in South Africa Donald H. Akenson, 1991 [The Refrigerator and the Universe](#) Martin Goldstein, Inge F. Goldstein, 1993 C. P. Snow once remarked that not knowing the second law of thermodynamics is like never having read Shakespeare. Yet while many people grasp the first law of energy, Energy can neither be created nor destroyed, few recognize the second: Entropy can only increase. What is entropy anyway, and why must it increase? Whether we want to know how a device as simple as a refrigerator works or understand the fate of the universe, we must start with the concepts of energy and entropy. In *The Refrigerator and the Universe*, Martin and Inge Goldstein explain the laws of thermodynamics for science buffs and neophytes alike. They begin with a lively presentation of the historical development of thermodynamics. The authors then show how the laws follow from the atomic theory of matter and give examples of their applicability to such diverse phenomena as the radiation of light from hot bodies, the formation of diamonds from graphite, how the blood carries oxygen, and the history of the earth. The laws of energy, the Goldsteins conclude, have something to say about everything, even if they do not tell us everything about anything.
