Question 8:

Why is the number of trophic level restricted to four or five in a food chain?

Answer 8:

The number of trophic levels in a food chain is restricted to four or five due to energy loss and inefficiency as it moves up the chain. With each trophic level, only about 10% of energy is transferred to the next level, resulting in diminishing energy availability. This limits the number of levels as insufficient energy remains to support additional trophic levels beyond four or five.

Question 9:

What is the difference between energy flow and biogeochemical cycle in an ecosystem?

Answer 9:

Energy flow and biogeochemical cycles are both essential processes in ecosystems but differ in their focus and mechanisms:

Energy Flow

Energy flow refers to the transfer of energy through an ecosystem, typically from producers to consumers and decomposers.

Energy enters ecosystems through sunlight and is converted into chemical energy by producers through photosynthesis.

Energy flows through trophic levels as organisms consume and metabolize food, with much of it being lost as heat during metabolic processes.

Biogeochemical Cycle

Biogeochemical cycles involve the cycling of nutrients and elements through living organisms, the atmosphere, soil, and water in an ecosystem.

Unlike energy flow, which involves the one-way transfer of energy, biogeochemical cycles involve the cycling of elements such as carbon, nitrogen, phosphorus, and water between biotic and abiotic components of the ecosystem.

These cycles include processes such as photosynthesis, respiration, decomposition, nitrogen fixation, and denitrification, among others.

Question 10:

How are camels able to survive in extreme heat?

Answer 10:

Camels are adapted to survive in extreme heat due to several physiological and behavioral adaptations. Their thick coat reflects sunlight and provides insulation, while their ability to conserve water allows them to tolerate dehydration. Camels also have specialized nostrils that reduce water loss during exhalation and efficient kidneys that concentrate urine. Additionally, they can tolerate high body temperatures and can sweat without losing excessive amounts of water.

Question 11:

Why does polar bear have thick fur over their body?

Answer 11:

Polar bears have thick fur over their bodies to provide insulation and retain body heat in their cold Arctic habitat. Their fur consists of two layers: a dense undercoat of short hairs and an outer layer of longer guard hairs that repel water and snow. This insulating fur helps polar bears maintain their body temperature in freezing conditions, essential for their survival in the harsh Arctic environment.
