

## EXERCISE 1: DATA INTERPRETATION

Dissolved oxygen is oxygen that is trapped in a fluid. Since many living organisms require oxygen to survive, it is a necessary component of water systems (streams, lakes, rivers, etc.). Dissolved oxygen is measured in units of parts per million (ppm). Examine the data in Table 4, which shows the amount of dissolved oxygen present in a body of water and the number of fish observed in the sample. Then, answer the questions below.

**Table 4: Water Quality vs. Fish Population**

Dissolved Oxygen (ppm)	0	2	4	6	8	10	12	14	16	18
Number of Fish Observed	0	1	3	10	12	13	15	10	12	13

1. What patterns do you observe based on the information in Table 4?

This is a data table saying that when the oxygen goes up, the fish population goes up.

2. Develop a hypothesis relating to the amount of dissolved oxygen measured in the water sample and the number of fish observed in the body of water.

The more dissolved oxygen in the water the more fish, until you reach 12 then it seems to dissipate a bit or stay around the same number of fish after the dissolved oxygen reaches 12.

3. What would your experimental approach be to test this hypothesis?

I would use the fish testing the dissolved oxygen as I add more fish.

4. What would be the independent and dependent variables?

My independent variable would be the dissolved oxygen and the dependent variable would be the fish

5. What would be your control? The dissolved oxygen
