

Carbon Cycle and Greenhouse Gases

REMEMBER

Photosynthesis uses CO_2 and water to make glucose and oxygen. Plants release CO_2 back into the atmosphere when they respire. Greenhouse gases such as water vapor, carbon dioxide, and methane in the atmosphere keep the Earth warm.

REMEMBER

Global warming is the long-term increase in the average temperature of the Earth's atmosphere and oceans. Global warming is caused by the increase in greenhouse gases in the atmosphere. Greenhouse gases trap heat in the atmosphere, causing the Earth's temperature to rise.

Greenhouse gases include water vapor, carbon dioxide, methane, and nitrous oxide. These gases are released into the atmosphere by natural processes such as respiration and decomposition. Human activities such as burning fossil fuels and deforestation also release greenhouse gases into the atmosphere. The increase in greenhouse gases has led to global warming, which is the long-term increase in the average temperature of the Earth's atmosphere and oceans.

One of the greenhouse gases released by plants is water vapor. Plants release water vapor through a process called transpiration. Transpiration is the process by which water moves from the roots of a plant to the leaves, where it is released into the atmosphere as water vapor. Transpiration is an important part of the water cycle and helps to cool the plant.

THE CARBON CYCLE

Carbon is an element that is found in all living and non-living things. Carbon is an important part of the carbon cycle, which is the process by which carbon moves through the atmosphere, land, and oceans. The carbon cycle is a continuous process that has been going on for billions of years.
