Chapter 8 Earthquakes and Earth's Interior

Summary

8.1 What Is an Earthquake?

☞ Faults are fractures in Earth where movement has occurred.

- An **earthquake** is the vibration of Earth produced by the rapid release of energy within the lithosphere.
- Earthquakes are caused by slippage along a break in the lithosphere, called a **fault**.
- The point within Earth where an earthquake starts is called the **focus**.
- The energy released by an earthquake travels in all directions from the focus in the form of **seismic waves**.
- The movement that occurs along faults during earthquakes is a major factor in changing Earth's surface.
- The **epicenter** is the location on the surface directly above the focus.

☞ According to the **elastic rebound hypothesis**, most earthquakes are produced by the rapid release of energy stored in rock that has been subjected to great forces. When the strength of the rock is exceeded, it suddenly breaks, releasing some of its stored energy as seismic waves.

- Forces inside Earth slowly deform the rock that makes up Earth's crust, causing rock to bend.
- **Elastic rebound** is the tendency for the deformed rock along a fault to spring back after an earthquake.
- An **aftershock** is an earthquake that occurs sometime soon after a major earthquake.

8.2 Measuring Earthquakes

☞ Earthquakes produce two main types of seismic waves—body waves and surface waves.

- There are two types of body waves: P waves and S waves.
- **P waves** are push-pull waves that push (or compress) and pull (or expand) particles in the direction the waves travel.
- **S waves** shake particles at right angles to the waves' direction of travel.
- When body waves reach the surface, they produce **surface waves**. Surface waves are the most destructive seismic waves.

☞ Scientists have developed an instrument to record seismic waves—the **seismograph**.

- A seismograph produces a time record of ground motion during an earthquake called a **seismogram**. A seismogram shows all three types of seismic waves.
