

CONCEPT MAP

PATHOPHYSIOLOGY

- Chronic kidney disease (CKD) is initially described as diminished renal reserve or renal insufficiency, which may progress to renal failure (end-stage renal disease). Initially, as renal function declines, there are few noticeable abnormalities because the remaining tissue increases its performance (renal functional adaptation).
- Decreased renal function interferes with the kidney's ability to excrete fluid and electrolyte homeostasis. The ability to concentrate urine declines early and is followed by decreases in ability to excrete excess phosphate, acid, and potassium. When renal function is advanced (glomerular filtration rate (GFR) < 15 mL/min/1.73 m²), the ability to effectively dilute or concentrate urine is lost; thus, urine osmolality is usually fixed at a level 300 to 900 mOsm/kg, close to that of plasma (275 to 295 mOsm/kg), and urinary volume does not respond readily to variations in water intake.

COMPLICATIONS

- Gout.
- Anemia.
- Metabolic acidosis.
- Bone disease and high phosphorus (hyperphosphatemia).
- Heart disease.
- High potassium (hyperkalemia).
- Fluid buildup.

DIAGNOSIS

- Electrolytes, blood urea nitrogen (BUN), creatinine, phosphate, calcium, complete blood count (CBC).
- Urinalysis (including urinary sediment examination).
- Quantitative urine protein (24-hour urine protein collection or spot urine protein to creatinine ratio).
- Ultrasoundography.
- Sometimes renal biopsy.

Chronic Renal Failure

RISK FACTORS

- Diabetes.
- High blood pressure.
- Heart and blood vessel (cardiovascular) disease.
- Smoking.
- Obesity.
- Being African-American, Native American, or Asian-American.
- Family history of kidney disease.
- Abnormal kidney structure.

NURSING INTERVENTIONS

- Management includes correction of fluid and electrolyte levels; avoidance of nephrotoxins; and kidney replacement therapy, when appropriate. Several recent studies support the use of acetylcysteine for the prevention of acute renal failure in patients undergoing various procedures.

Manifestations

- weight loss and poor appetite.
- swollen ankles, feet, or hands – as a result of water retention (edema)
- shortness of breath.
- tiredness.
- blood in your pee (urine)
- an increased need to pee – particularly at night.
- difficulty sleeping (insomnia)
- itchy skin.
