The Permaculture Activist ,2004      **Re-crafting the Earthbag Wall** Tiffanie Leung,2022 Earthbag construction also

known as flexible form rammed earth construction takes advantage of the earthbag's capabilities to contain and support the earth as it is compressed in a wall formation and hardens. Due to the simplicity of its construction process, earthbag construction is an affordable and easily replicable building system that can be erected quickly in response to disasters and offer alternative building techniques to the DIYer. Within the context of craft earthbag building techniques are passed down in training workshops by experts and people with experience or through do it yourself guides making it more accessible than building techniques that require certifications. However, while earthbag construction is inexpensive, available locally, and does not require high levels of expertise or skill to construct, it is also not as robustly tested as other earth construction techniques. Since its conception as a method of construction in the 1990s by Nader Khalili, earthbag construction also has not significantly progressed in technique, tooling, or resultant building form. This thesis argues that limitations in bag shape, size, and production, in addition to undiscerning replication of style and methods, contribute to earthbag construction's stagnation in design. Therefore, this research asserts that changes to bag geometry can add expressive variability and utility to the earthbag. The sewing machine is the selected tool for customized earthbag production and geometric manipulation in this study. As a form of craft that is democratically accessible, machine sewing is regarded as the fastening of textile objects together with mechanized needle and thread, and the hand-making skill associated with it. The sewing machine's accessibility mirrors that of earthbag construction, which is also low cost, has a low skill requirement, and adopts a standardizing approach to its process. This research aims to explore how sewn earthbag craft fits within the context of self-built earthbag construction. A design as research approach was used to probe earthbag construction, creating novel bag geometries derived from existing earthbags and textiles from scratch, all prototypes varying in bag material and production process. One prototype geometry was selected as a case study for bag production using the sewing machine and was replicated to observe hypothetical wall systems, production, and resultant wall, and their impact on the construction process with regards to on-site tooling, labor, crafting experience, and resultant architecture.
