

CHAPTER - 1

ELECTRIC CHARGES AND FIELD

Electrostatics deals with the study of forces, fields and potentials arising from static charges

Electric Charge-

It is the basic physical property of matter and due to this property, a force is experienced when kept in the field of electricity. Electric charges are of two types.

1. Positive Charge

Lesser number of electrons than a number of protons

Positive charges or protons have a charge of $+1.6 \times 10^{-19}$ Coulomb. A positive charge has its field lines emerging from within and going up to infinity

2. Negative Charge

More number of electrons than number of protons

Negative charges or Electrons have a charge of -1.6×10^{-19} Coulomb. A Negative charge has its field lines coming from infinity.

The above example where hair strands start to attract to the ruler is due to electric charges. Similarly, rubbing a balloon on hair attracts hair to the balloon. In case two balloons are simultaneously rubbed the balloons will start to repel each other, but they will attract the hair strands.

The rate of change of electric charge is known as Electric current, $I = q/t$

Did You know

Electric charge, which can be positive or negative, occurs in discrete natural units and is neither created nor destroyed.

Conductors and Insulators

Conductors- Conductors are the materials or substances which allow electricity to flow through them. They conduct electricity because they allow electrons to flow easily inside them from atom to atom. Also, conductors allow the transmission of heat or light from one source to another. Metals, humans, earth, and animals are all conductors. This is the reason we get electric shocks! Moreover, the human body is a good conductor. So it provides a resistance-free path for the current to flow from wire to body. Conductors have free electrons on its surface which allow current to pass through
