

Electrical Circuits

A complete path, or circuit, is needed before voltage can cause a current flow through resistances to perform work.

There are several types of circuits, but all require the same basic components. A power source (battery or alternator) produces voltage, or electrical potential. Conductors (wires) connect circuit elements together in path for current flow. Working devices, or loads (lamps, motors), change the electrical energy into another form of energy to perform work. Control devices (switches, relays) turn the current flow on and off. And, protection devices (fuses, circuit breakers) interrupt flow.

Current path of too much current flows. This amount current is called *overcurrent*, which could damage conductors and working devices. A list of five things to look for in any circuit:

1. Source of Voltage
2. Protection Device
3. Load
4. Control
5. Ground

This will be identifying these items when we look at Automotive Circuits a little later in this book.
