

BIOLOGY 1406 - CHAPTER 1

METHODS AND CONCEPTS OF BIOLOGY

1. Biology is the study of life.
2. Living things are characterized by eight characteristics of life, while nonliving things do not exhibit the same characteristics. Living things represent a highly coordinated set of chemical and physical processes that are manifested as the phenomenon we call life.
3. The eight characteristics of life are listed and defined below.
 - A. **SPECIFIC ORGANIZATION** - Refers to cellular organization and to the commonality of organization shared between all living things.
 - B. **METABOLISM** - The total or sum of all chemical activity in a living thing.
 - C. **HOMEOSTASIS** - The maintenance of a constant internal environment; chemical and physical.
 - D. **GROWTH** - An increase in size by the addition of new living tissue; the formation of new cytoplasm and cell parts.
 - E. **MOVEMENT** - Movement that results from the efforts and expenditure of energy by the organism.
 - F. **RESPONSIVENESS** - The ability to sense and respond to stimuli from the environment and from within.
 - G. **REPRODUCTION** - The ability to produce offspring like the parent(s) either by asexual or sexual means.
 - H. **ADAPTATION** - The ability of a population or species to adjust to the environment over time through genetic change. Individuals do not adapt; they acclimate as they adjust to the environment within their individual range of genetic tolerance.
4. Biological and ecological organization ranges from atoms or atomic particles to the biosphere which is all life on Earth and its physical environment.

- CHEMICAL LEVELS

Atomic particles - Neutrons, protons and electrons

Atoms - Smallest or simplest particles of an individual element that exhibits its chemical and physical characteristics, i.e. hydrogen, oxygen, carbon.

Molecules - Any two or more atoms bonded together

Compounds - Substance made of molecules composed of the atoms of two or more elements in a fixed ratio, i.e. H_2O , $C_6H_{12}O_6$.

- CELLULAR LEVEL

Organelles - Cell parts such as mitochondria, chloroplast, nucleus, etc.

Cells - The basic unit of life. All living things are composed of cells and/or cell products.

Evolutionary Cell Processes in Primates M. Kathleen Pitirri, Joan T. Richtsmeier, 2021-09-14 Many complex traits define the primate condition including behaviors as fundamental as locomotion and traits as scrutinized as the dentition and their study reveals dramatic evolutionary change across the primates Genetic modifications are at the basis of these changes but transformation of genetic information into phenotypes occurs at the level of the cell which is the focus of this book Contributors summarize novel methodologies to analyze the collective behavior of cells in forming tissues and organs influencing physiological functions and anatomical features that enable behaviors Our goal is to review current knowledge and encourage others to

adopt evolutionary cell biology to aid in deciphering the genotype phenotype map that underlies the diversification of primates human variation and human evolution The contributors to this book utilize advances in genetic analysis and visualization of cells and tissues and merge evolutionary developmental biology with evolutionary cell biology to address questions central to understanding human and primate evolution Key Features Explores mechanisms underlying trait development distribution variation and evolution especially with respect to pigmentation dental formulae the skeleton energetics and temperature related morphological variation Documents the advantages for anthropologists to work at the level of cells focusing on how genes provide instructions for cells to make structure and how environment affects the behavior of cells Illustrates the role cell biology plays in pelage growth and pigmentation facial morphology melanin production in pigmentation dental development and tooth loss and energy expenditure Describes novel methodologies and techniques to analyze environment and temperature related influences on phenotypes Demonstrates how significant changes in life history occur at the level of the cell Related Titles Bianchi L Developmental Neurobiology ISBN 978 0 8153 4482 7 King G R Primate Behavior and Human Origins ISBN 978 1 138 85317 1 Rhys Evans P H The Waterside Ape An Alternate Account of Human Evolution ISBN 978 0 367 14548 4 CSIR NET Life Science - Unit 11 - Evolution Mr. Rohit Manglik,2024-07-12 EduGorilla Publication is a trusted name in the education sector committed to empowering learners with high quality study materials and resources Specializing in competitive exams and academic support EduGorilla provides comprehensive and well structured content tailored to meet the needs of students across various streams and levels

Stardust Sun Kwok, 2013-04-08 How did life originate on Earth For over 50 years scientists believed that life was the result of a chemical reaction involving simple molecules such as methane and ammonia cooking in a primordial soup Recent space observations have revealed that old stars are capable of making very complex organic compounds At some point in their evolution stars eject those organics and spread them all over the Milky Way galaxy There is evidence that these organic dust particles actually reached the early Solar System Through bombardments by comets and asteroids the young Earth inherited significant amounts of stardust Was the development of life assisted by the arrival of these extraterrestrial materials In this book the author describes stunning discoveries in astronomy and solar system science made over the last 10

years that have yielded a new perspective on the origin of life Other interesting topics discussed in this book The discovery of diamonds and other gemstones in space The origin of oil Neon signs and fluorescent lights in space Smoke from the stars Stardust in our hands Where oceans come from The possibility of bacteria in space *Leaves of Healing* ,1928 **Human Biology and Health** Michael J.
