### CONCEPTS AND METHODS

#### *Fill-in-the -Blanks*

The fundamental unit of life is called the (1) \_\_\_\_\_. Within these cells the signature, or defining, molecule is a nucleic acid known as (2) \_\_\_\_\_. Encoded within the structure of the genetic material are the instructions needed for the manufacturing of (3) \_\_\_\_\_. The building blocks used during the assembly of these molecules are the (4) \_\_\_\_\_. When supplied with energy, a specialized group of proteins, called the (5) \_\_\_\_\_, act as worker molecules, which serve by rapidly building, splitting, or rearranging the wide variety of complex molecules needed for life. Another nucleic acid, called (6) \_\_\_\_\_, assists the enzymes in carrying out DNA'S protein..building instructions. Thus, the information originates in the (7) \_\_\_\_\_ and flows to the (8) \_\_\_\_\_, resulting in the formation of a(n) (9) \_\_\_\_\_. The passing of traits from the parent to the offspring by means of DNA is called (10) \_\_\_\_\_. The physical mechanism by which these traits are transferred is called (11) \_\_\_\_\_. For multicellular organisms such as plants and animals, which consist of specialized cells, tissues, and organs, the process of (12) \_\_\_\_\_ is directed by the instructions contained within the DNA. The work of the cell in assembling, Splitting, and rearranging the structure of molecules requires an input of (13) \_\_\_\_\_, which represents the capacity to do work. (14) \_\_\_\_\_ refers to the cell's capacity to obtain and convert energy from its surroundings and to use that energy to maintain itself, grow, and produce more cells. In leaves, for example, specialized cells carry out the process of (15) \_\_\_\_\_ by intercepting energy from the sun and converting it into chemical energy molecules called (16) \_\_\_\_\_. In turn, these molecules transfer energy to the (17) \_\_\_\_\_ of metabolic pathways. ATP energy molecules may also be formed by (18) \_\_\_\_\_. This process can release energy that cells have tucked away in sugars and other kinds of molecules. Organisms sense changes in their surroundings, then make controlled, compensatory (19) \_\_\_\_\_ to them. To accomplish this, special molecules and structures called (20) \_\_\_\_\_ detect (21) (plural) \_\_\_\_\_. A (22) (singular) \_\_\_\_\_ is a specific form of energy detected by receptors. Sunlight, heat, (23) \_\_\_\_\_ and mechanical stress are all examples of stimuli. Cells adjust metabolic activities in response to signals from receptors. For example, after a snack, simple sugars and other molecules leave the gut and enter the blood, which is part of a(n) (24) \_\_\_\_\_ environment. Blood sugar levels then rise and stimulate secretion of the hormone insulin by the pancreas. Most of the cells in your body have (25) \_\_\_\_\_ for this hormone. Insulin stimulates cells to take up sugar molecules from the internal environment and return blood sugar concentration levels to normal. Organisms respond so exquisitely to energy changes that their internal operating conditions remain within tolerable limits. This is called a state of (26) \_\_\_\_\_, one of the key defining features of life.
